IndexEdge

Installation & User Guide

Nifty 50, Bank Nifty & Sensex trading assistant for Angel One

This guide takes you from download to your first paper trade, then explains every screen with pictures.

Version 1.3 · October 2026 · Windows 10/11
Screenshots were taken in **demo mode** (synthetic prices, no broker connected), so the prices and statistics shown in them are not real market data.

1. What IndexEdge does — and what it will never claim

IndexEdge runs on your own Windows PC and watches **Nifty 50**, **Bank Nifty** and **Sensex** (index, futures and options) through Angel One SmartAPI. It:

- **Checks external markets first** — GIFT Nifty, US index futures, Asian indices, India VIX, USD/INR, the dollar index, US 10-year yield, Brent crude, news and an event calendar. If this context is stale or markets are risk-off, it does not produce a signal.
- **Scans 19 widely used Indian strategies** on every closed 5-minute candle (table below).
- **Explains each signal** in plain English: which rules were met, the external context, related news, and the statistics of similar past setups.
- **Measures, never claims, accuracy.** Every probability shown comes from its own out-of-sample backtests after Indian F&O costs, with a 95% confidence range and the number of past trades.
- **Can trade for you on Angel One** — paper by default — using only LIMIT and stop-loss-limit orders, with hard risk limits and a one-click kill switch.
- **Helps you learn** with strategy explainers, past-day replay, quizzes and an automatic trade journal.

About "95–98% accuracy"

No publicly available intraday index strategy has independently verified accuracy at that level. Claims you see online usually ignore costs, cherry-pick periods or hide a few large losses behind many small wins. IndexEdge marks a strategy with a 🏅 **High win-rate** badge when it wins at least 80% of the time, but always shows reward-to-risk and expected profit next to it — and warns you when the expected profit is zero or negative.

The 19 strategies

Strategy	Idea in one line
Opening Range Breakout	Close beyond the 09:15–09:30 range with volume confirmation.
VWAP Pullback	Join a trend on a pullback to VWAP and a strong re-close.
EMA + Supertrend + ADX	EMA 9/21 trend with a Supertrend(10,3) close and ADX > 22.
Triple Supertrend	Enter when Supertrends (10,1), (11,2), (12,3) first agree.
CPR + Floor Pivots	Narrow-CPR breakout, or wide-CPR fade of R1/S1 back to the pivot.
CPR + VWAP Confluence	Trade pullbacks when price is above TC and VWAP (or below BC and VWAP).
Volatility Squeeze Breakout	First bar after Bollinger Bands sat inside Keltner Channels.
RSI Divergence Reversal	Price makes a new extreme that RSI(14) does not confirm.
OI / PCR Bias	Option-chain PCR extremes plus a VWAP cross; OI walls as targets.
9:20 Short Straddle	Sell the ATM straddle at 09:20 with 25% per-leg stops (paper-only model).
Expiry-day Iron Fly	On expiry day sell the 10:00 ATM straddle with protective wings.
Gap Fill / Gap-and-Go	Fade a 0.3–1.5% opening gap toward yesterday's close, or ride it.
Inside Bar Breakout	Break of a 15-minute mother bar after an inside bar.
EMA Pullback	In an up/down trend, buy/sell the pullback to EMA 21 on a rejection candle.
Fibonacci Pullback	Enter the 38.2–61.8% retracement of a confirmed impulse leg on a reversal close.
Supertrend Pullback	Supertrend(10,3) trend; enter when price pulls back near the line and resumes.
Breakout Retest	Trade the retest of a broken previous-day high/low or opening range when it holds.
Bollinger Reversion	Range days only: close outside the band, re-entry inside, target the middle band.
MACD Trend	MACD signal cross on the EMA 200 side with a growing histogram.

1a. The three indices: Nifty, Bank Nifty and Sensex

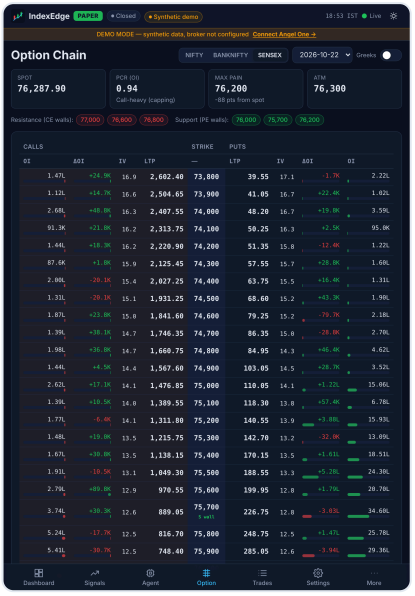

Every feature — signals with entry, stop-loss and targets, the Agent, the option chain, Strategy Lab, Replay, Learn, paper trading and the iPad trade ticket — works the same way for all three. Pick the index with the cards on the Dashboard or the switch at the top of each page.

Index	Index exchange	Options / futures in Angel One	Lot size*	Expiry*
NIFTY (Nifty 50)	NSE	**NFO**	65	Weekly, Tuesday
BANKNIFTY (Nifty Bank)	NSE	**NFO**	30	Monthly only, last Tuesday
SENSEX	BSE	**BFO**	20	Weekly, Thursday

* As of October 2026. IndexEdge always reads the real lot size, strikes and expiry dates from Angel One's instrument master each morning, so exchange changes are picked up automatically. If an expiry day is a holiday the expiry moves to the previous trading day.

Dashboard on a phone with the Sensex card selected: chart, levels, PCR and max pain for Sensex. Demo data.

Sensex option chain on an iPad — the next Thursday expiry, 100-point strikes, OI walls. Demo data.

Sensex orders are on BFO

When you place a Sensex trade by hand, search the symbol from the ticket (e.g. `SENSEX…CE`) under **BFO** in Angel One, not NFO. The ticket shows the exchange.

Accuracy is measured separately for each index

A strategy that works on Nifty is not assumed to work on Sensex. Each strategy is validated on each index's own real history and only gives Sensex signals once it passes there; with fewer than 50 samples the win rate shows "insufficient data" instead of a number.

2. Before you start

You need	Why
A Windows 10 or 11 PC that is on during market hours	IndexEdge runs on it and places orders from it.
Internet connection	Market data, external indices and news.
An Angel One account with F&O enabled	To receive data and place orders. Not needed for demo mode.
A **static IPv4 address** from your internet provider	Angel One accepts API *orders* only from the IP registered on your SmartAPI app. Needed only for live trading — demo and paper trading work without it.
Telegram (optional)	Alerts and one-tap confirm buttons on your phone, anywhere.

Nothing else to install

The installer downloads its own private copy of Python. It needs no administrator rights (except once, optionally, to let your phone reach the app), no Docker and no Node.js. Everything stays inside the IndexEdge folder.

You can install and explore IndexEdge right away in **demo mode**, before you have your SmartAPI keys or a static IP. Demo mode uses synthetic prices and labels every statistic “SYNTHETIC — not real performance”.

3. Install on Windows

1. **Extract the ZIP.** Right-click `IndexEdge-v1.0-windows.zip` → *Extract All…* and choose a simple location such as `C:\`. You get a folder `C:\IndexEdge`.
2. **Run the installer.** Open the folder and double-click `install.bat`. If Windows SmartScreen shows "Windows protected your PC", click *More info* → *Run anyway*.

ILLUSTRATION

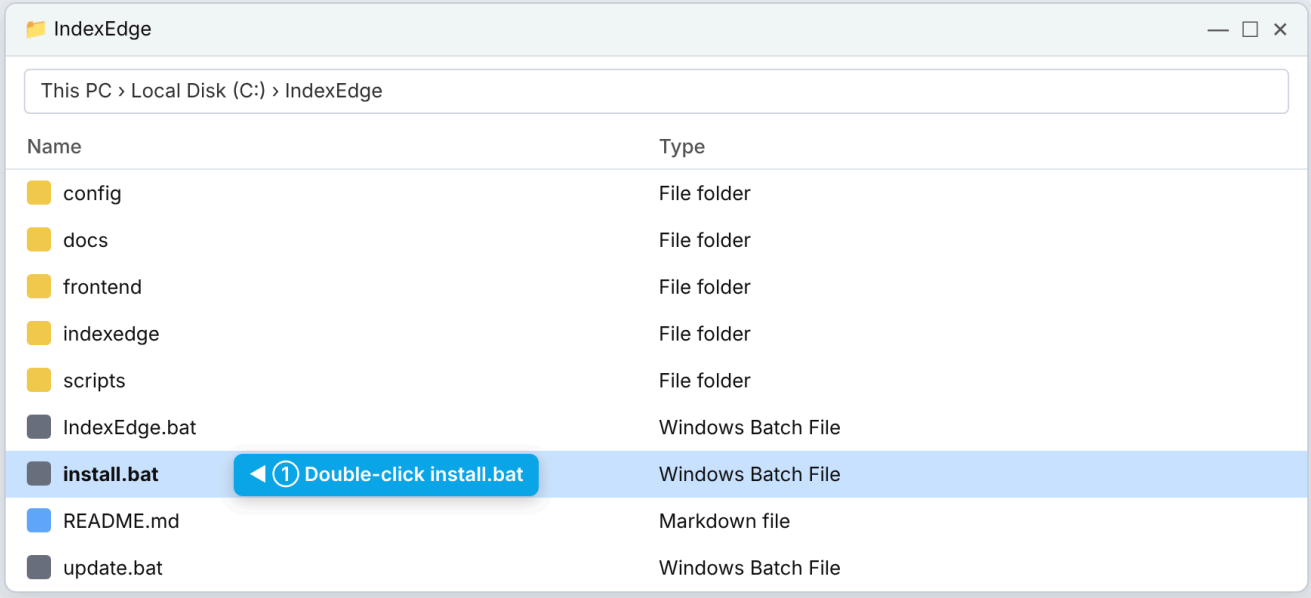

Illustration: the extracted IndexEdge folder.

3. **Answer the setup questions** (or press Enter to skip each one and fill them in later under Settings). Your API key, client code, PIN and TOTP secret are stored in **Windows Credential Manager**, never in files. The first run takes a few minutes while Python libraries download.

ILLUSTRATION

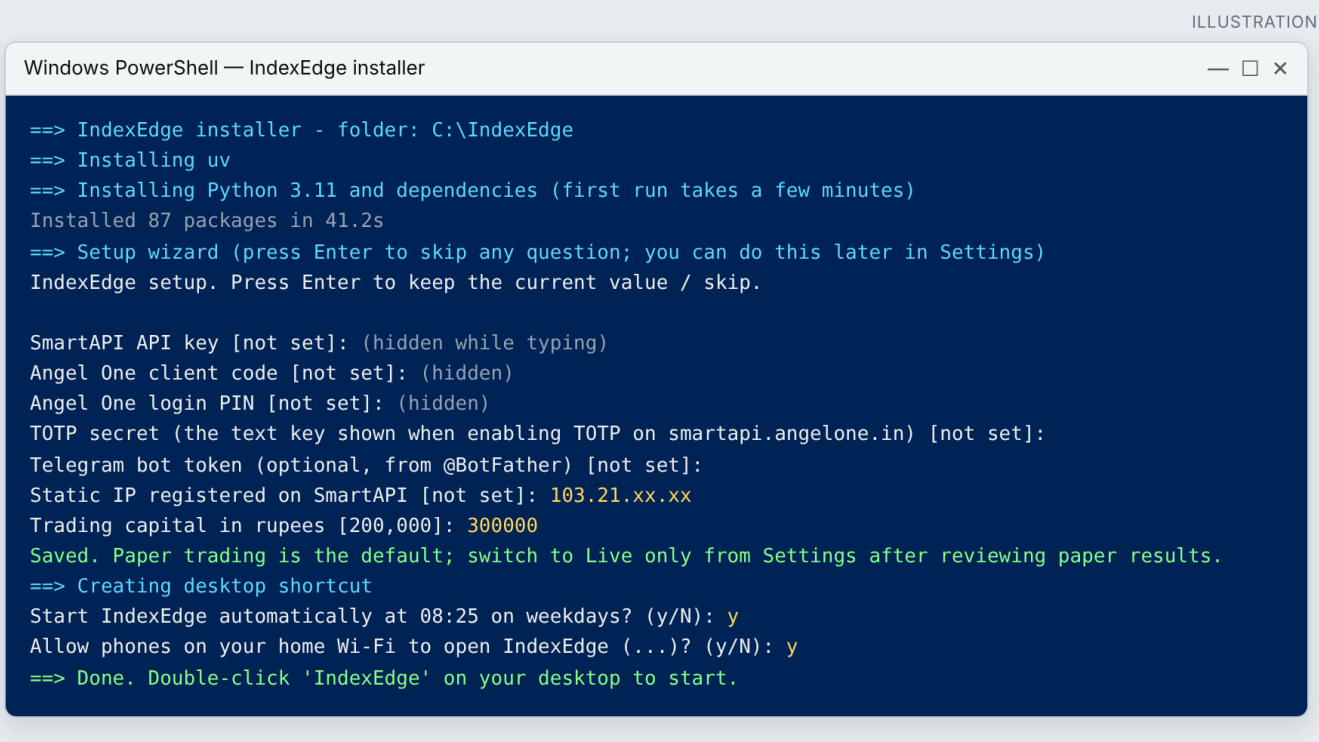

Illustration: the installer window. Secret answers are hidden while you type.

4. **Auto-start (optional).** Answer **y** to start IndexEdge at 08:25 every weekday, before the 08:30 login.
5. **iPad / phone access.** Create your IndexEdge login (username + password) when asked, answer **y** to the firewall rule (Windows asks for administrator approval once) and to "stop this PC from sleeping while plugged in". See section 6.
6. **Start IndexEdge** with the new desktop icon. A small black window opens (keep it open — it *is* IndexEdge) and your browser shows the app at `http://localhost:8000`.

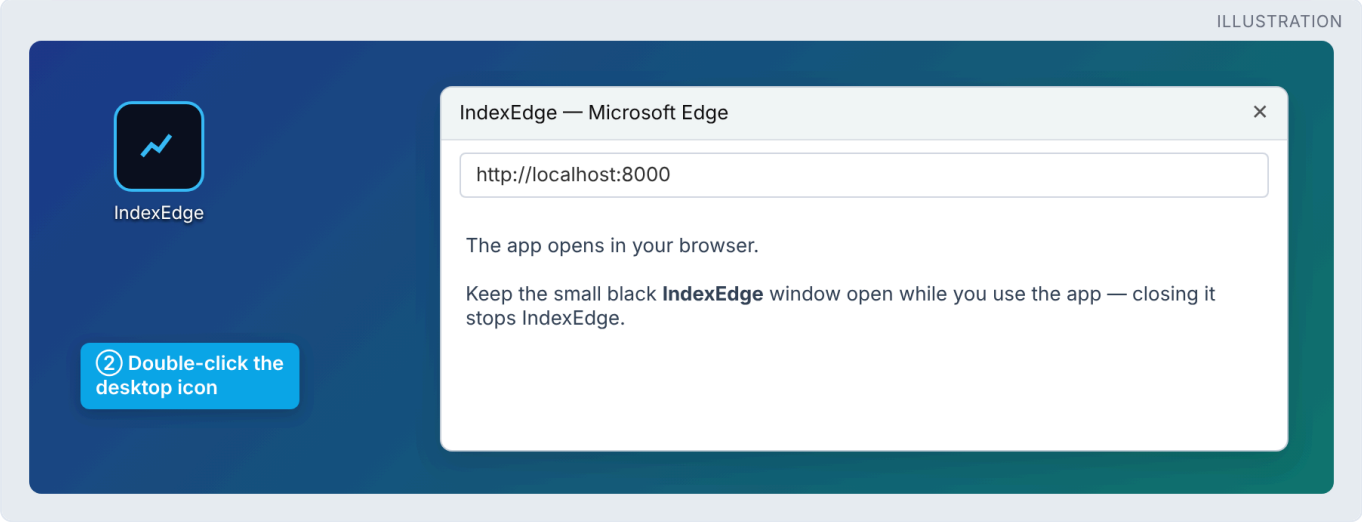

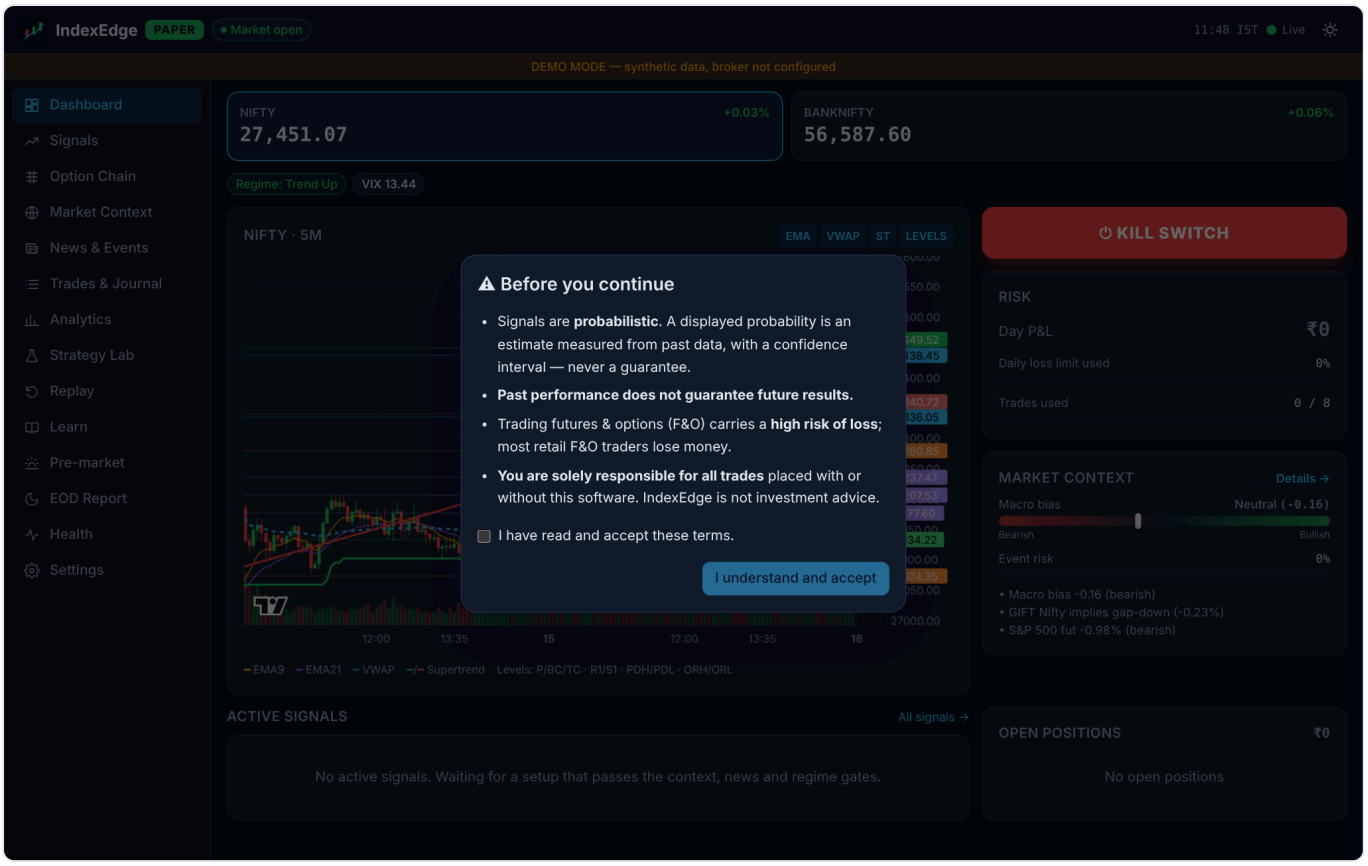

Illustration: starting IndexEdge from the desktop.

Update later by double-clicking `update.bat`. Your data (journal, settings, history) is in the `data` folder — copy it to back up.

4. First launch

On first launch IndexEdge shows its risk disclaimer. Tick the box and press **I understand and accept**.

The first-launch disclaimer. Note the amber DEMO MODE bar at the top.

The header bar

- **PAPER / LIVE** badge — green PAPER means no real orders are sent. LIVE is red.
- **Market open / closed**, the IST clock and a connection dot (green = live updates flowing).
- **Coloured bars** under the header warn you about demo mode, missing real history, safe mode, or a live configuration that is currently executing on paper.
- The sun/moon button switches between dark and light themes.

5. Connect your Angel One account

“Redirect URL not accepted”? Use https://smartapi.angelone.in/

Angel One only accepts a secure `https://` web address as the Redirect URL — `localhost:8000`, `http://` addresses and IP addresses are rejected. IndexEdge logs in with your PIN + TOTP and **never uses the redirect URL**, so Angel One’s own site is a safe value.

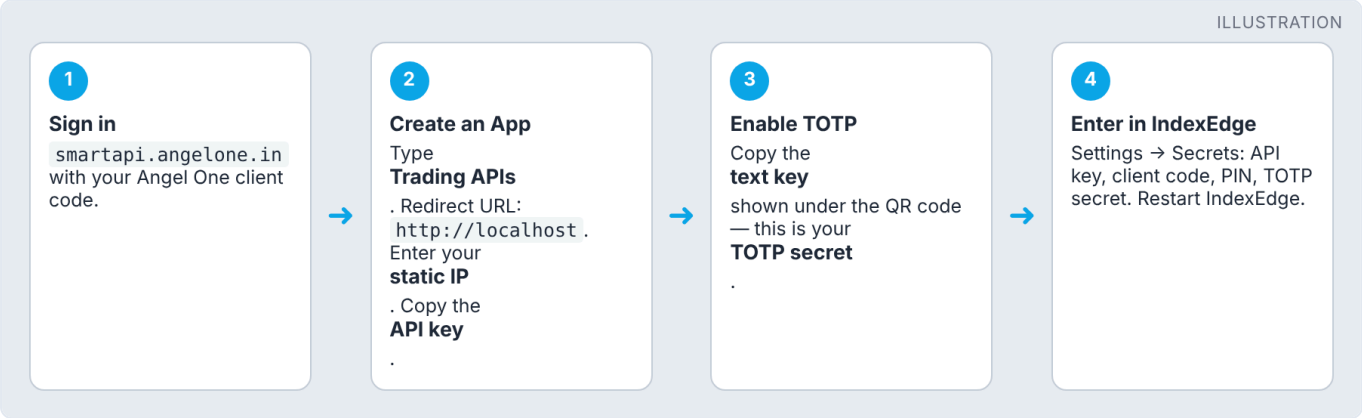

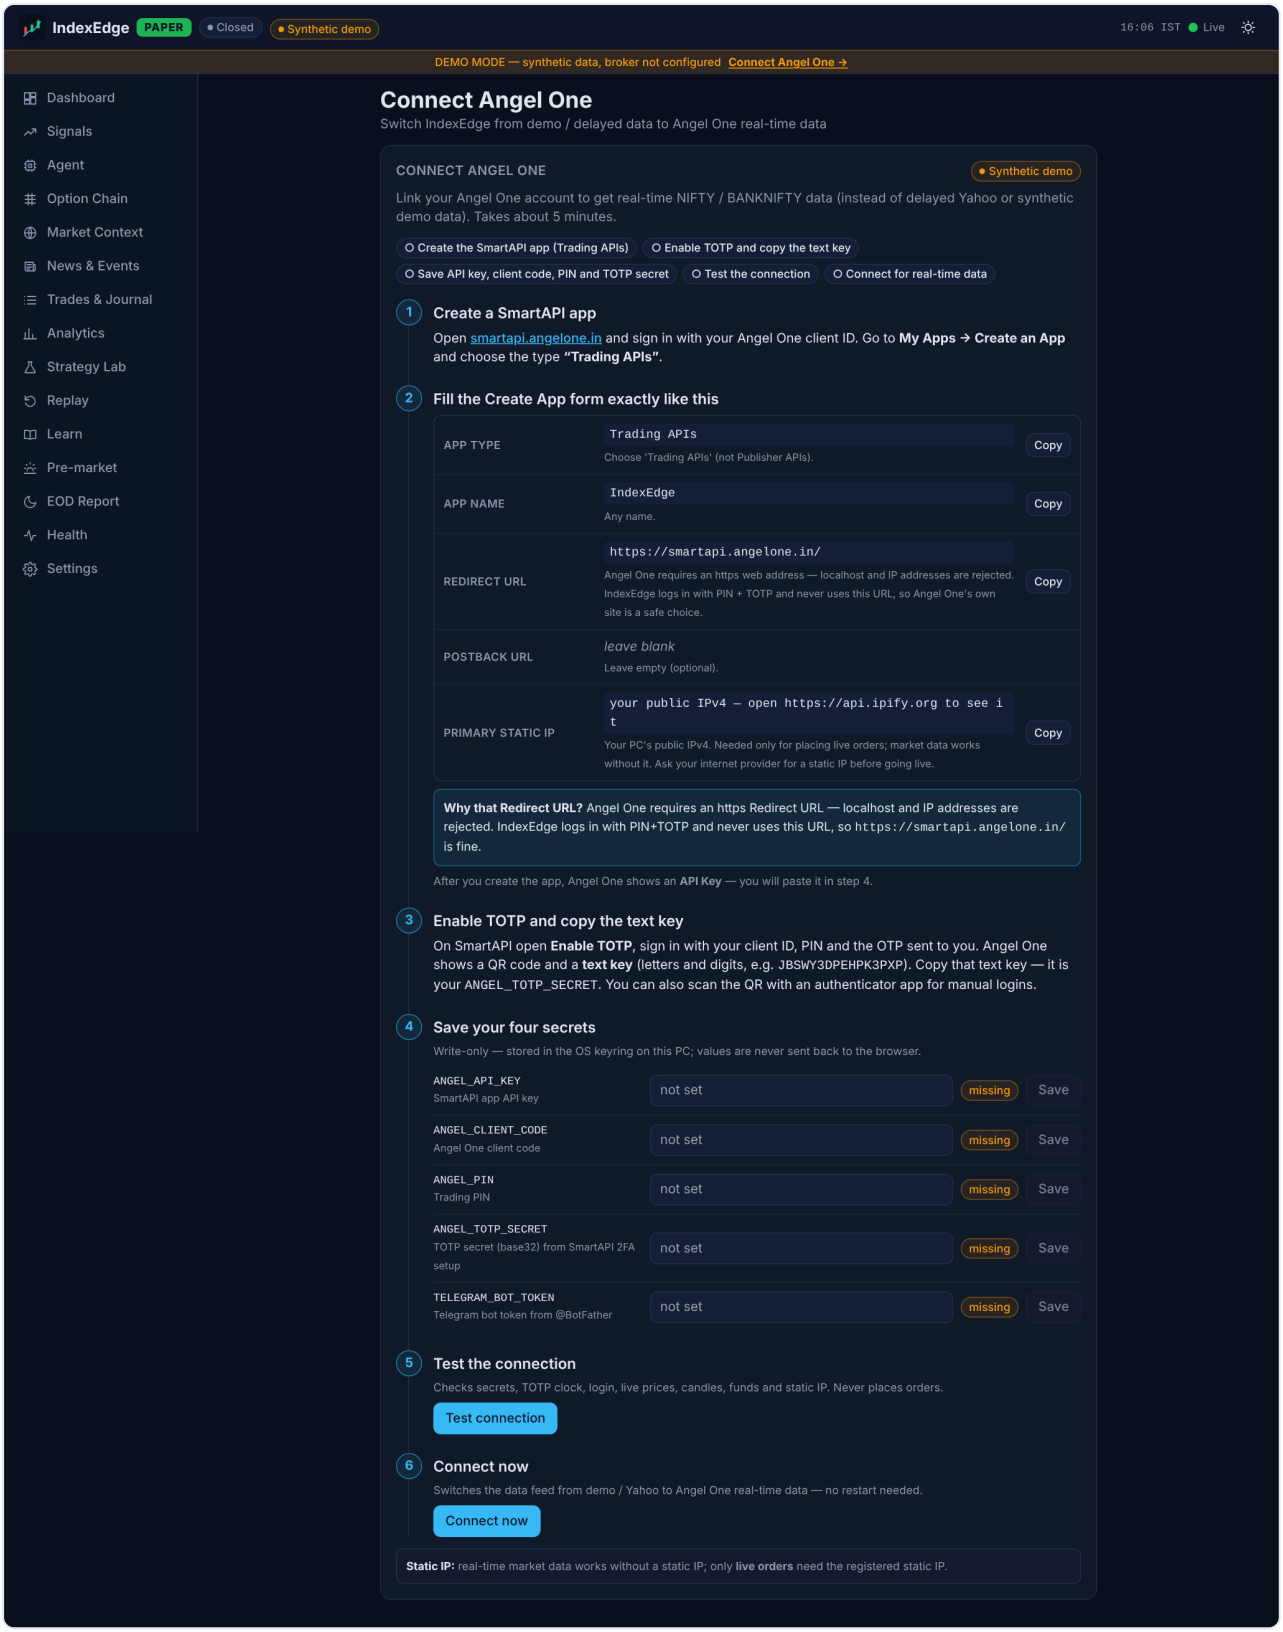

Illustration: creating your SmartAPI app and TOTP secret.

SmartAPI “Create App” field	What to type
App type	**Trading APIs**
App name	IndexEdge (any name)
Redirect URL	`https://smartapi.angelone.in/`
Postback URL	leave empty
Primary static IP	your PC’s public IPv4 — shown in IndexEdge under **Settings → Connect Angel One**

1. Sign in at `smartapi.angelone.in`, choose **Create an App** and fill the form as in the table. Copy the **API key**.
2. **Enable TOTP**. Copy the **text key** shown under the QR code — this is your TOTP secret.
3. In IndexEdge open **Settings → Connect Angel One** (or the “Connect Angel One →” link in the demo banner) and save the API key, client code, PIN and TOTP secret.
4. Press **Test connection**. Each step shows ✓ or ✕ with what to fix: secrets, PC clock (TOTP needs the right time), login, live Nifty, Bank Nifty and Sensex prices, candles, funds and static IP. **It never places orders.**
5. Press **Connect now**. IndexEdge switches to Angel One’s real-time feed without restarting and logs in by itself at 08:30 every trading day from then on.

The Connect Angel One wizard.

Data now, static IP later

Real-time market data does **not** need the static IP — only live orders do. Before you connect at all, IndexEdge already shows **real Nifty, Bank Nifty and Sensex prices from Yahoo Finance** (they can lag 1–2 minutes and have no index volume). The header badge always shows the source: **Live · Angel One**, **Yahoo · delayed** or **Synthetic demo**.

Static IP protection

IndexEdge compares your public IP with the registered one at startup and every hour. If they differ, live orders are blocked (paper trading continues) and you are alerted.

6. Use IndexEdge from your iPad (100% free)

How it works: your Windows PC runs IndexEdge — the engine that logs in to Angel One, streams real-time prices, runs the strategies and sends alerts. Your **iPad** (or any phone, tablet or browser) is the screen and remote control. You place the orders yourself in Angel One on the PC (or the Angel One app); IndexEdge gives you a ready-filled trade ticket, tracks the trade and tells you when to exit.

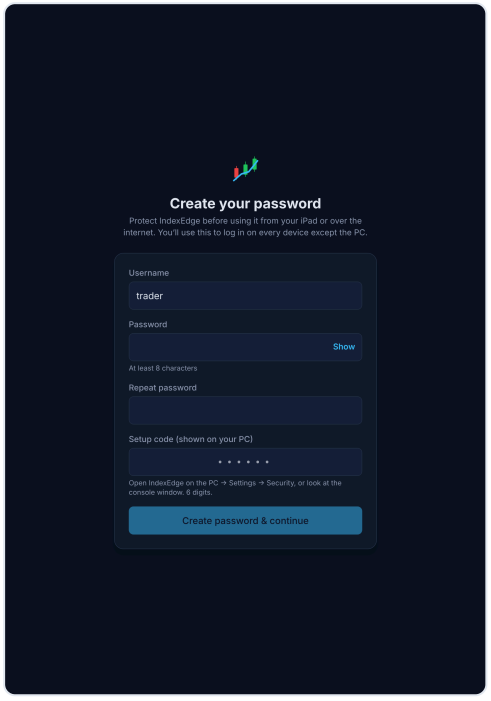

> **Everything is free**
>
> Angel One SmartAPI market data is free, the Cloudflare remote link is free and needs no account, Telegram is free. Because IndexEdge never places orders itself in this setup, **no static IP is needed**.

On the PC (once)

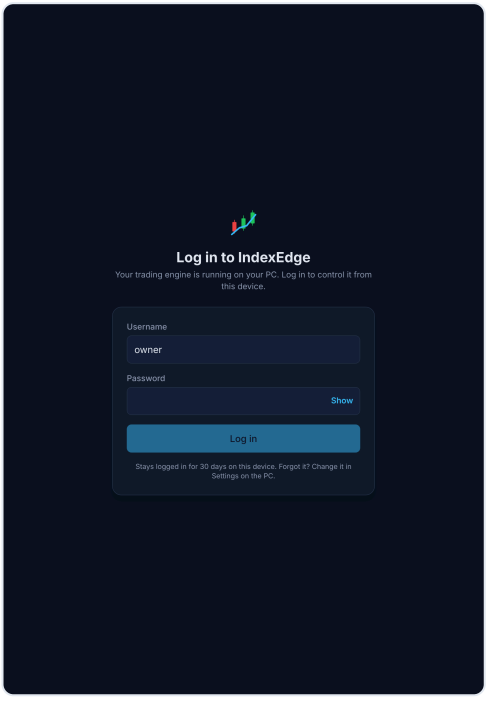

1. During `install.bat`, create your **IndexEdge login** (username + password, 8+ characters). Answer **Y** to the firewall question and to "stop this PC from sleeping while plugged in" — the iPad only works while the PC is on.
2. Start IndexEdge. The black window prints the address for the iPad, e.g. `http://192.168.1.25:8000`. If you skipped the password, it also prints a 6-digit **setup code**.

On the iPad — at home (same Wi-Fi)

1. Open **Safari**, type the address from the PC window and log in.
2. Tap **Share → Add to Home Screen**. IndexEdge now opens full-screen like an app.
3. Tap 🔔 **Enable sound** once (an iPad needs a tap before a web app may play alert sounds).

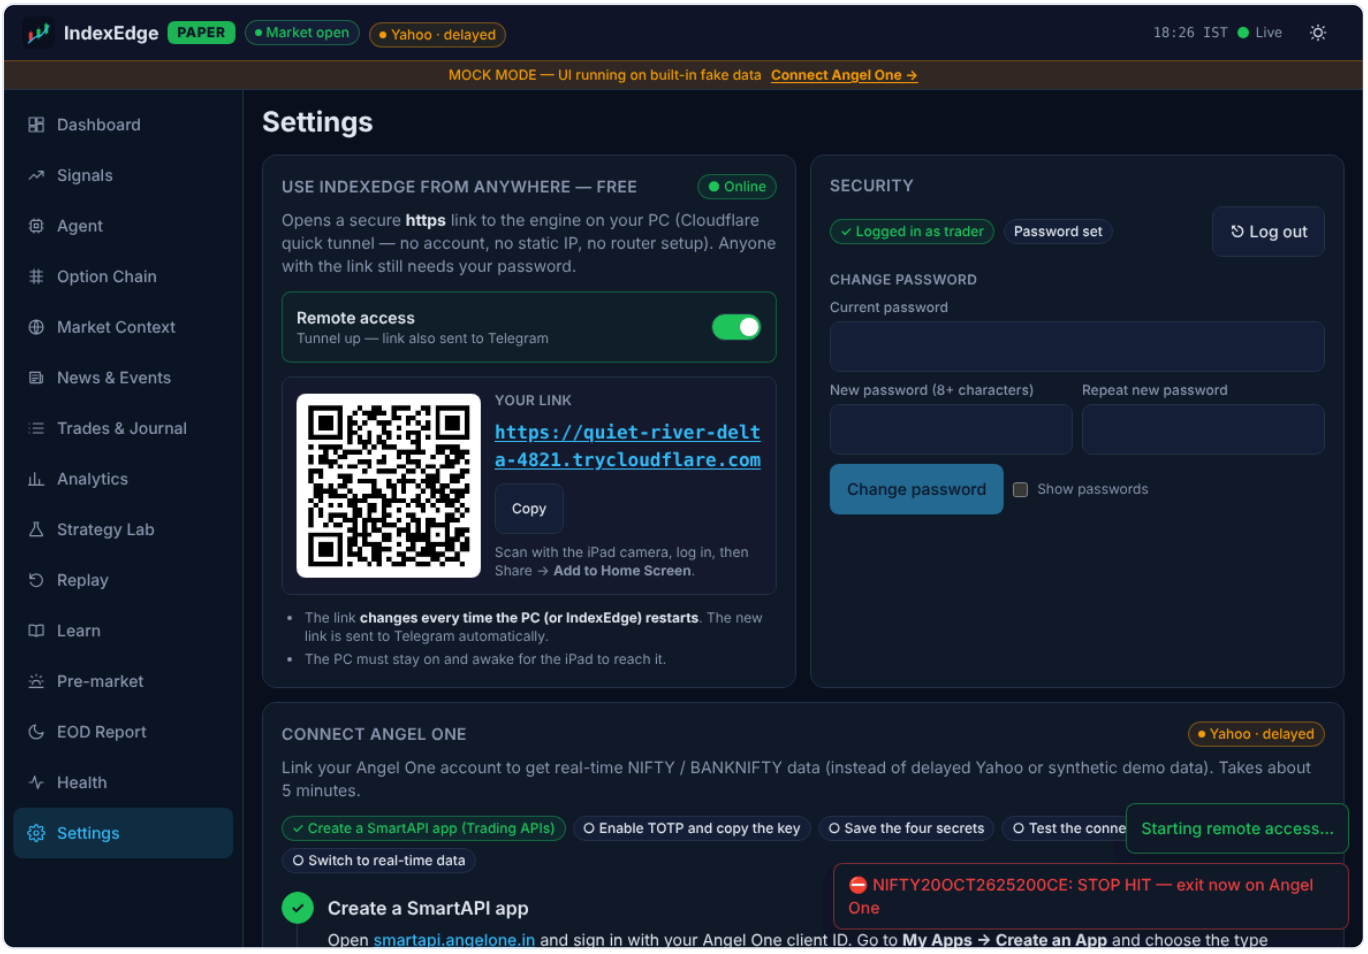

First time without a password: create it on the iPad with the setup code shown on the PC.

After that, the iPad just asks for your username and password. 5 wrong tries lock that device out for 15 minutes.

6. iPad — use it from anywhere

1. On the PC or iPad open **Settings → Use IndexEdge from anywhere** and switch **Remote access ON**. The first time, the PC downloads Cloudflare's free connector (~40 MB, one time).
2. A link like `https://quiet-river-blue-moon.trycloudflare.com` appears with a QR code. Scan it with the iPad camera, log in, then **Add to Home Screen**.
3. Every request through the link needs your password. The connection is https-encrypted end to end.

Settings on an iPad (landscape): remote link with QR code, and the Security card. Example data.

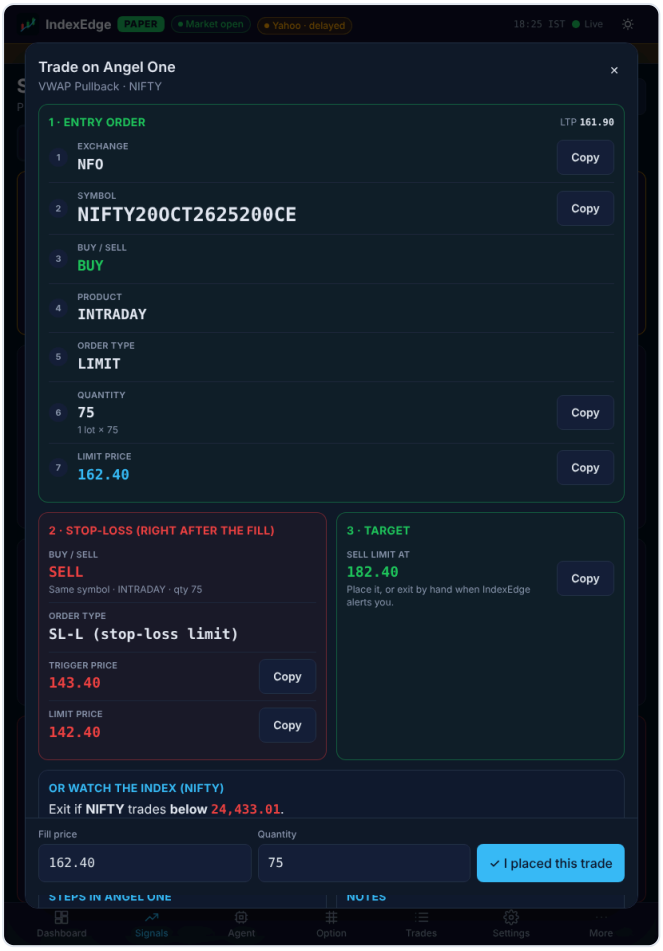

> **The free link changes**
>
> The quick link changes every time IndexEdge (or the PC) restarts. If Telegram is set up, the new link is sent to you automatically. A permanent link is possible with a free Cloudflare account (see Troubleshooting).

Connect Angel One from the iPad

Settings → Connect Angel One is the same wizard as section 5 and works from the iPad: create the SmartAPI app (Redirect URL `https://smartapi.angelone.in/`), paste the API key, client code, PIN and TOTP key, press **Test connection** and **Connect now**. The secrets are stored on the PC only (Windows Credential Manager); from then on the PC logs in to Angel One by itself every morning.

6. iPad — taking a trade on Angel One

When a signal appears (sound, banner and Telegram), open it, read **Why?**, then tap **Trade on Angel One**. The ticket lists every field of the Angel One order form, in order, each with a **Copy** button.

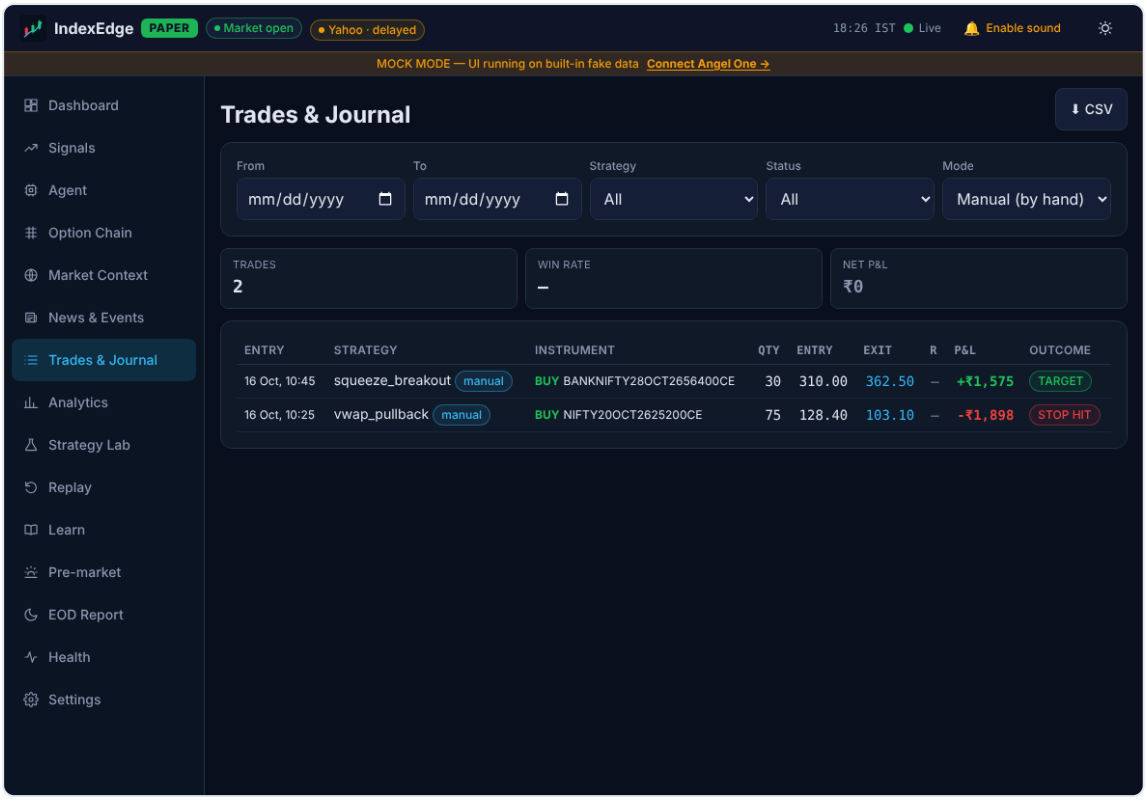

The trade ticket: entry order (LIMIT), stop-loss (SL-L) to place right after the fill, and the target. Example data.

After you tap **I placed this trade** with your real fill price, IndexEdge tracks it. Example data.

Step	On the iPad	In Angel One (PC or app)
1. Entry	Ticket shows symbol, BUY, INTRADAY, LIMIT, quantity and limit price	Place exactly that LIMIT order
2. Stop	Tap **I placed this trade**, enter the fill price	After the fill, place the SELL SL-L order (trigger + limit)
3. While open	Live P&L; red **STOP HIT — exit now** or green **TARGET REACHED** with sound + Telegram	Exit when told (or let your SL-L order do it)
4. Exit	Tap **I exited**, enter the exit price — journal and statistics update	—
15:15	**SQUARE OFF NOW** alert	Close anything still open (Angel One auto-squares at 15:20)

6. iPad — your manual trades and Telegram

Trades & Journal filtered to **Manual (by hand)**: every trade you took on Angel One with its result. Example data.

Manual trades are measured exactly like paper trades, so Analytics shows your real hit rate and expectancy — useful to see whether you follow the signals well. You can still run **Paper** mode and the **Agent** in parallel for simulated practice.

Telegram (works anywhere, also free)

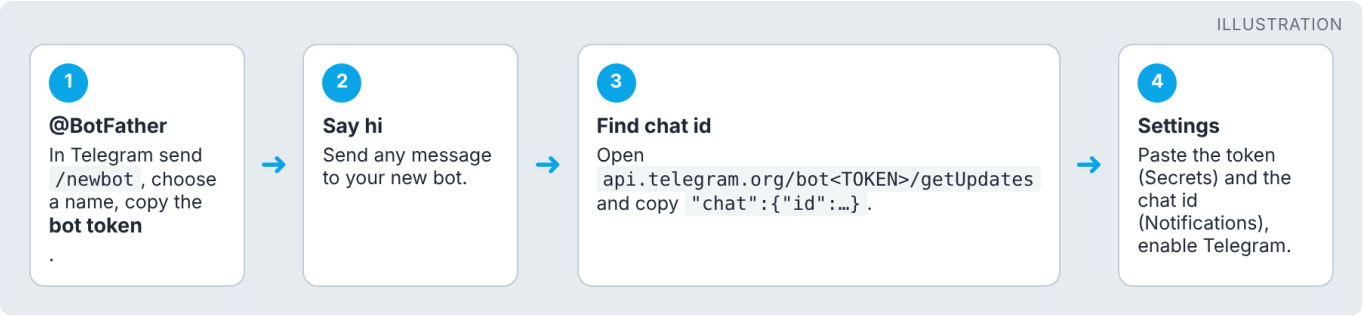

Illustration: creating your Telegram bot.

Telegram delivers new signals, stop/target/square-off alerts for your manual trades, the new remote link, high-impact news, the pre-market checklist and the end-of-day report. Only messages from your own chat id are accepted.

Forgot the password?

On the PC itself open **Settings → Security** and set a new one — the old password is not needed there. From the iPad or the remote link the old password is always required.

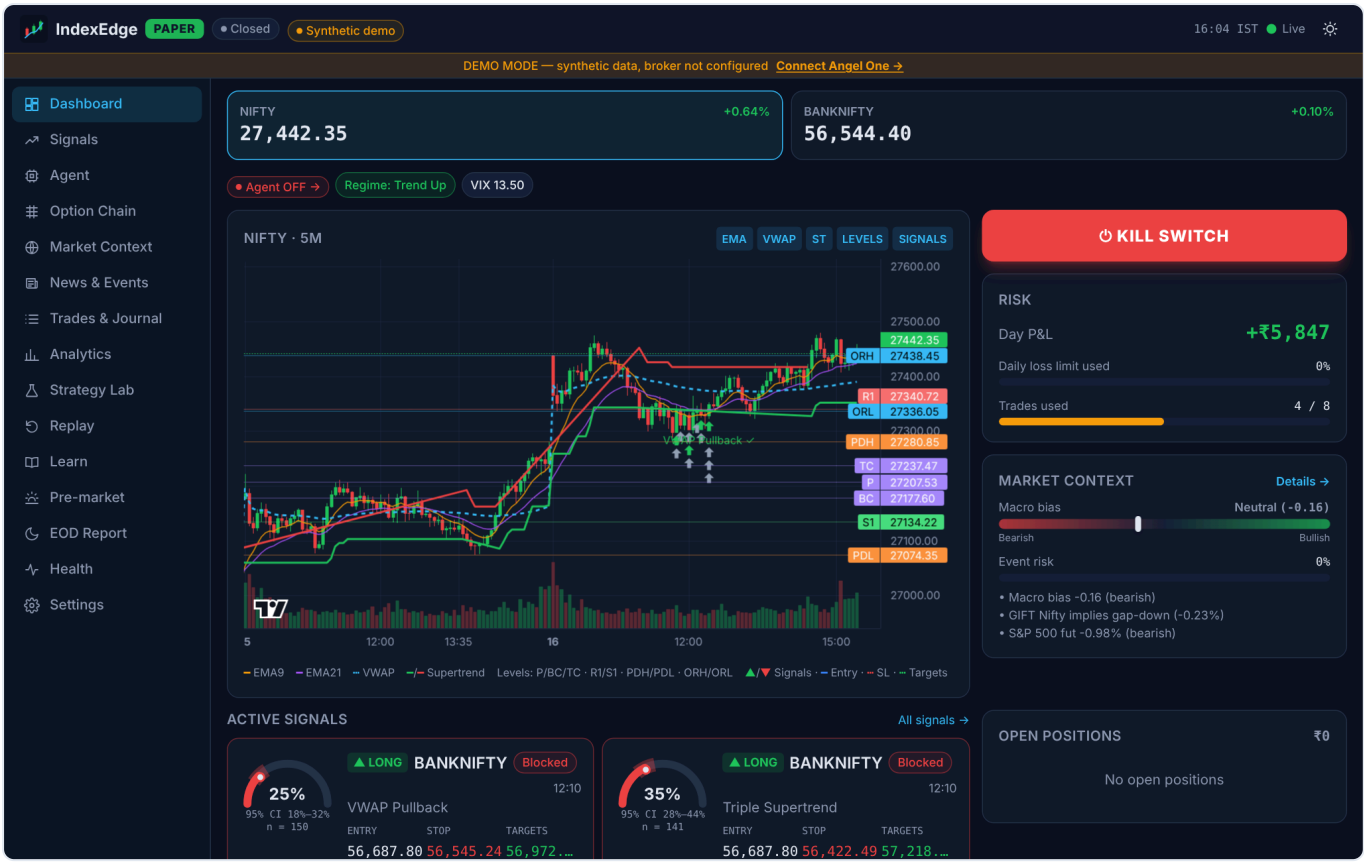

7. A trading day with IndexEdge

Time (IST)	What happens
08:25	IndexEdge starts (if auto-start is on).
08:30	Automatic login (PIN + TOTP), today's instrument list downloaded — lot sizes and expiries are read from Angel One, never hard-coded — and the static IP checked.
08:50	**Pre-market checklist** in the app and on Telegram.
09:15 – 15:30	Live 5-minute candles. On every closed candle each strategy is checked; signals pass through the safety gates (next page). No entries in the first 5 minutes or the last 20 minutes before cutoff.
15:15	Forced square-off of intraday trades (5 minutes before Angel One's 15:20 F&O cutoff).
15:45	**End-of-day report**.
Saturday 10:00	Strategies re-validated and probability models retrained on the latest real history.

How a signal is built — the gates

1. **Strategy trigger** on a closed candle (never on an unfinished one).
2. **External context gate** — required inputs (S&P 500 futures and India VIX by default) must be fresh; risk-off conditions (strongly negative global bias or VIX ≥ 22) block new signals.
3. **Event blackout** — no entries 15 minutes before/after high-impact events (RBI policy, Fed, CPI, Budget …).
4. **Regime filter** — each strategy declares the market regimes it works in.
5. **Validation** — only strategies validated on *real* data (or ones you enable yourself) are active. Others still appear as "blocked" so you can study them.
6. **Risk engine** — size, daily loss, trade count, losing streak, positions, margin, cooldown and stale-data checks.

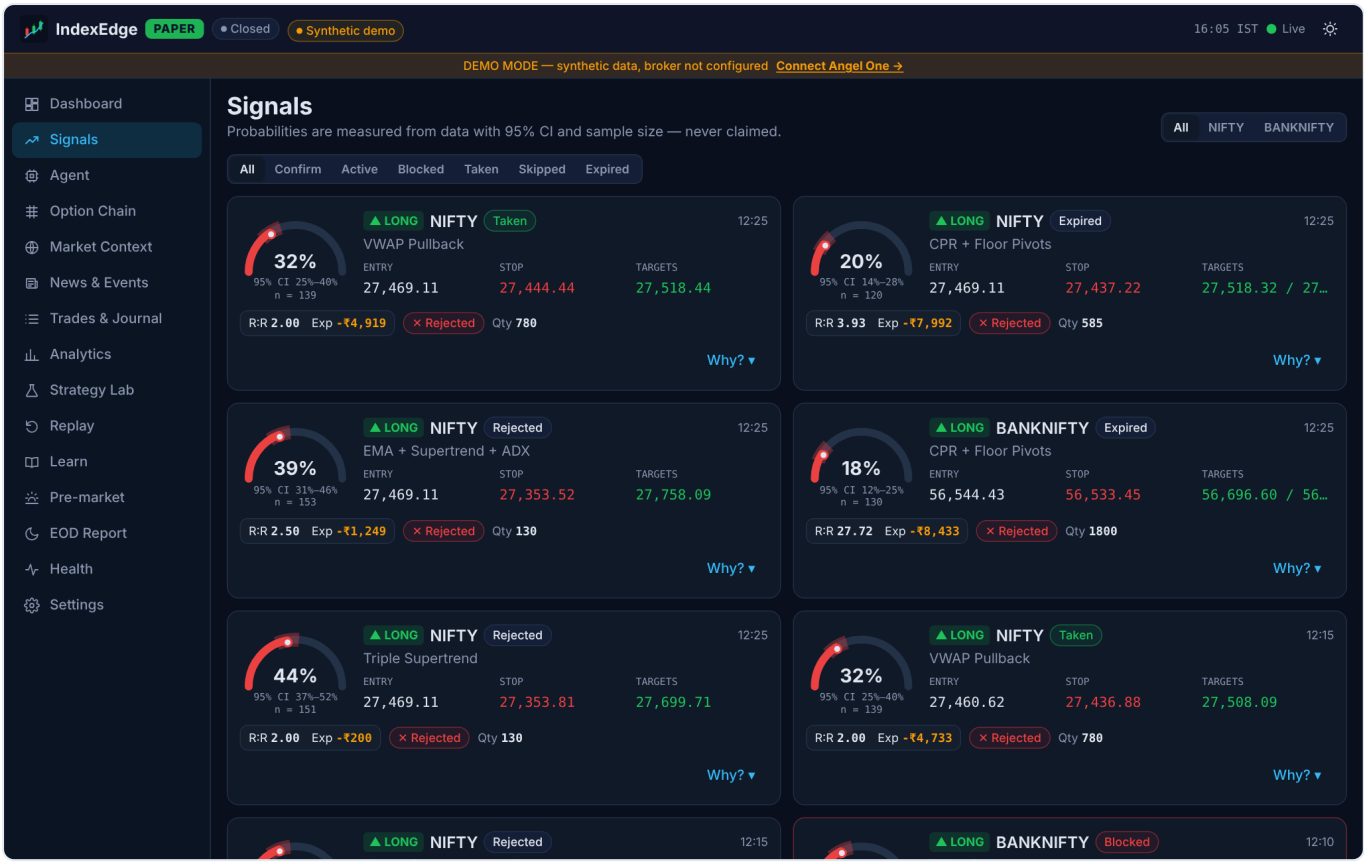

8. Dashboard

The Dashboard.

- **Index cards** — Nifty, Bank Nifty and Sensex price and change. Click to switch the chart.
- **Chips** — current market regime (trend up / trend down / range / high volatility), India VIX, PCR and max pain.
- **Chart** — 5-minute candles with EMA 9/21, VWAP, Supertrend and key levels: pivot and CPR (P/TC/BC), R1/S1, previous day high/low (PDH/PDL) and the opening range (ORH/ORL). Toggle overlays with the buttons above the chart.
- **Kill switch** — cancels every open order, squares off every position and locks trading for the day.
- **Risk** — today's P&L and how much of your daily loss limit and trade count is used.
- **Market context** — the global bias meter, event risk and the main reasons.
- **Active signals** and **open positions** with live P&L.

9. Signals and the “Why?” panel

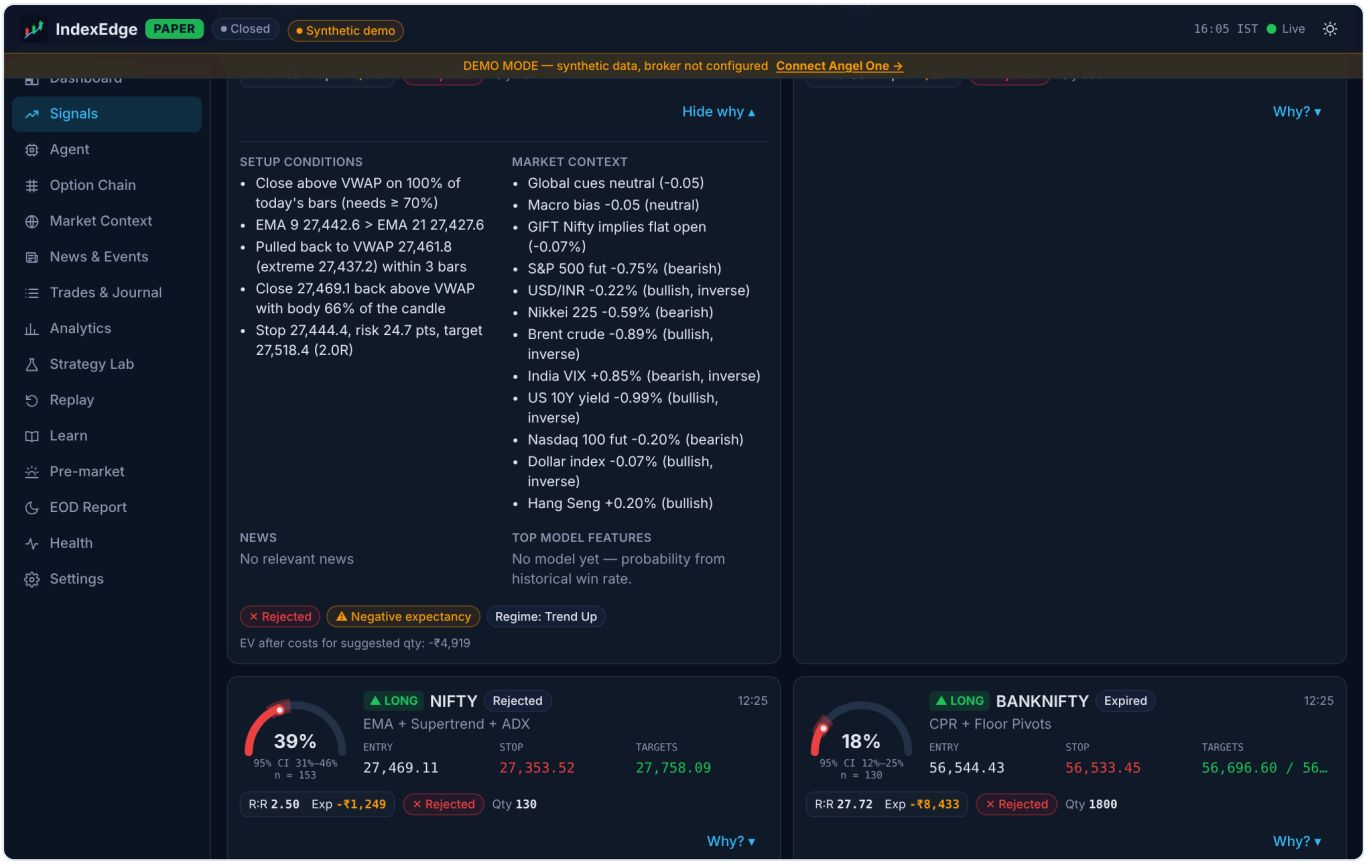

The Signals page. Filter by index and by status.

Reading a signal card

- **LONG / SHORT**, index and strategy, with entry, stop and targets.
- **Probability gauge** — the chance the target is hit before the stop, measured from past data, with its 95% confidence interval (CI) and sample size (n). Fewer than 50 past trades shows **Insufficient data** instead.
- **R:R** (reward-to-risk) and **Exp** — expected value per trade in R and in rupees after all costs.
- **Badges** — 🟢 Validated, 🏅 High win-rate (always next to R:R and expectancy), ⚠ negative-expectancy warning.
- **Status** — Active, Pending confirm, Blocked (with the reason), Taken, Skipped or Expired.
- **Qty and instrument** — the suggested option or future and the size your risk settings allow.

9. Signals — the “Why?” panel (continued)

Press **Why? ▾** on a signal to see every reason behind it.

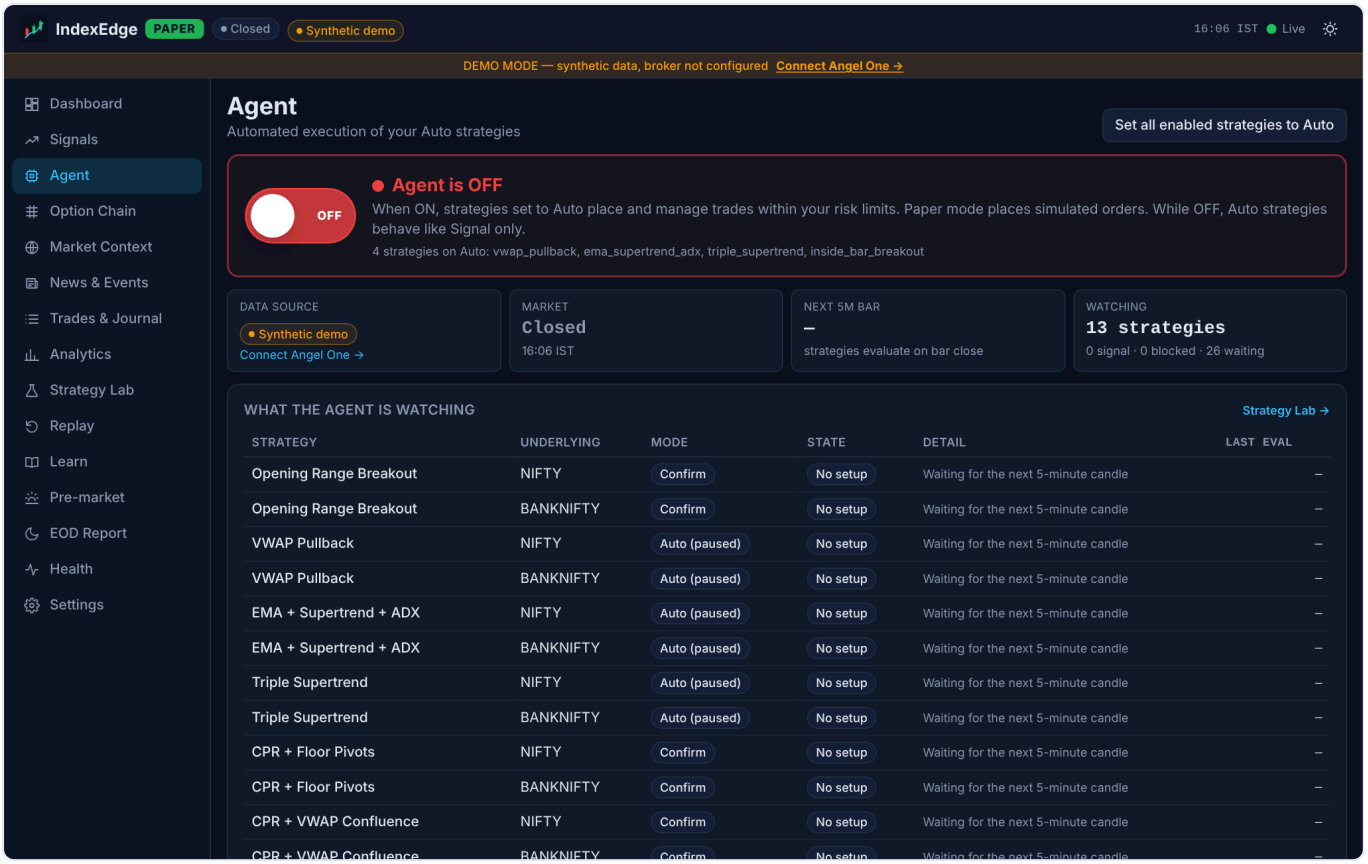

The Why panel lists each rule that was satisfied (with the actual numbers), the external context reasons, related news, the market regime and the features that pushed the probability up or down most.

Execution modes (set per strategy in Strategy Lab)

Mode	What happens
Signal only	You get the full plan as an alert; IndexEdge places nothing.
Confirm	IndexEdge prepares the order; press **Confirm** (in the app or Telegram) within 60 seconds, or **Skip**.
Auto	IndexEdge executes and manages the trade within your risk limits.

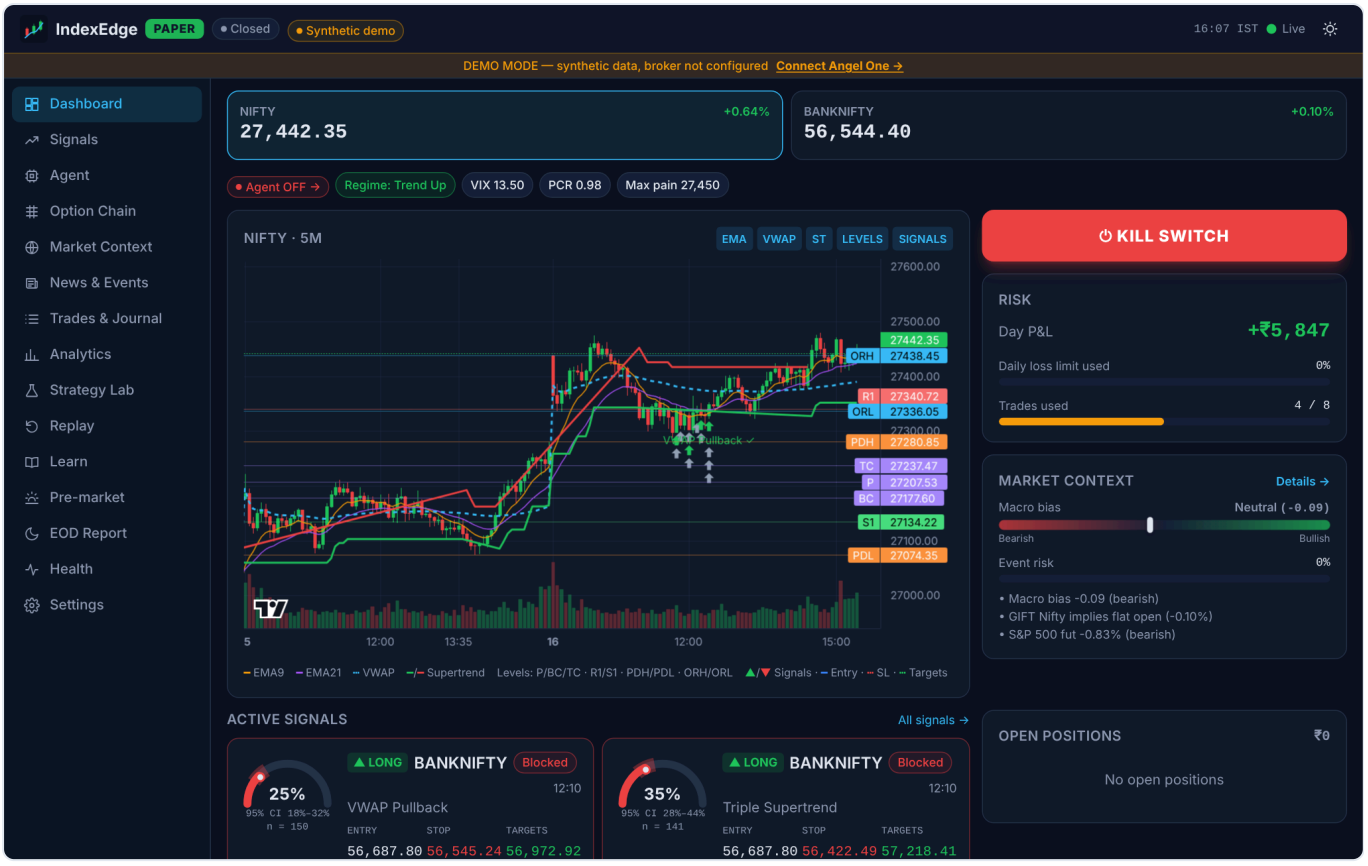

Orders are always LIMIT orders (re-priced up to 5 times if not filled) with a stop-loss-limit placed immediately after entry. At the first target half the position is booked and the stop moves to breakeven.

9a. The Agent — automatic trading on the chart

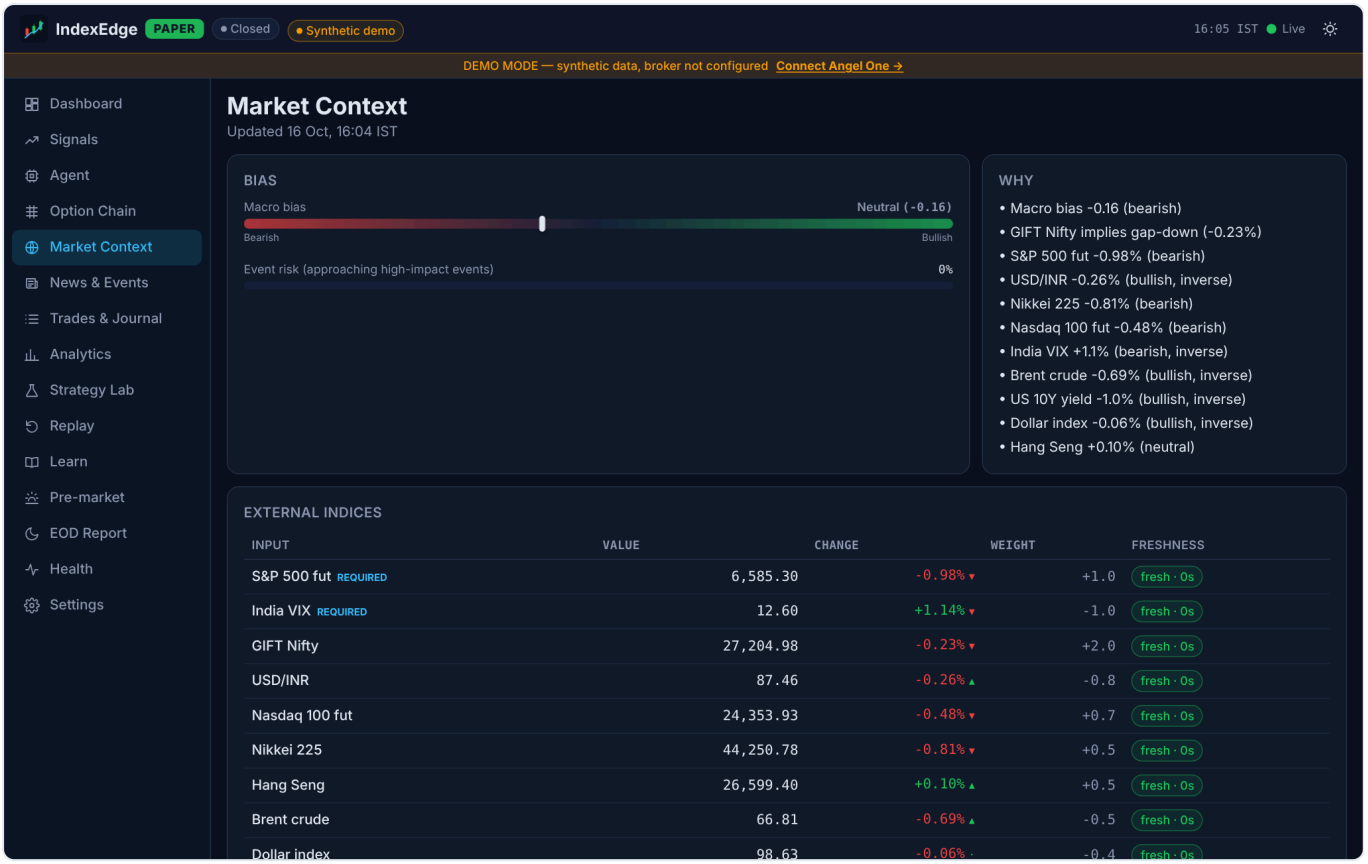

The Agent page: master switch, what every strategy is doing on this bar, and the live activity log.

- **Master switch.** Strategies set to **Auto** place and manage trades only while the Agent is **ON**. When it is OFF they behave like “Signal only”. In Paper mode the orders are simulated.
- **Set all enabled strategies to Auto** switches every enabled strategy to Auto in one go (you confirm first).
- **Watching** shows, for each strategy and index, its state on the latest 5-minute candle — signal, no setup (with the reason), blocked (with the gate that stopped it) or disabled — and a countdown to the next candle.
- **Activity log**: every scan, signal, gate decision, order, fill and exit, in plain English, as it happens.
- On the **Dashboard chart** every signal appears as an arrow, and open trades show their entry (blue), stop (red) and targets (green) as lines.

Signals and an open trade drawn on the Dashboard chart.

10. Market Context — external indices

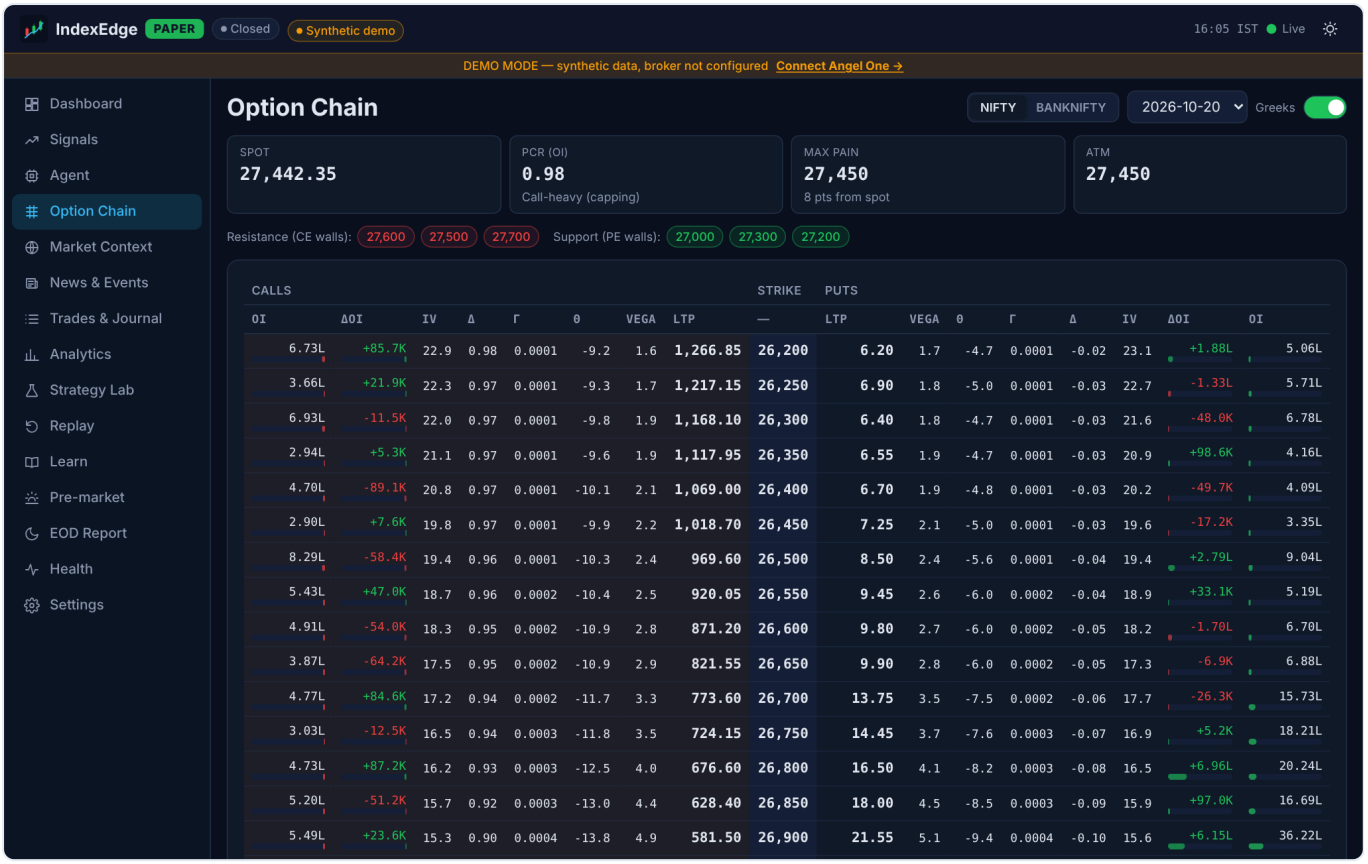

Every external input with its value, change, age and freshness.

IndexEdge turns these inputs into one **macro bias** from −1 (bearish) to +1 (bullish). Inputs that usually move *against* Indian equities — VIX, USD/INR, the dollar index, US yields and crude — count with a negative weight. Each input has a maximum age; if a **required** input is too old, signals are blocked with the reason “External context unavailable or stale”. You can change weights, required flags and ages in Settings.

GIFT Nifty

No free official GIFT Nifty feed exists, so this input is optional and needs a source URL in settings. When available it is used for the expected opening gap.

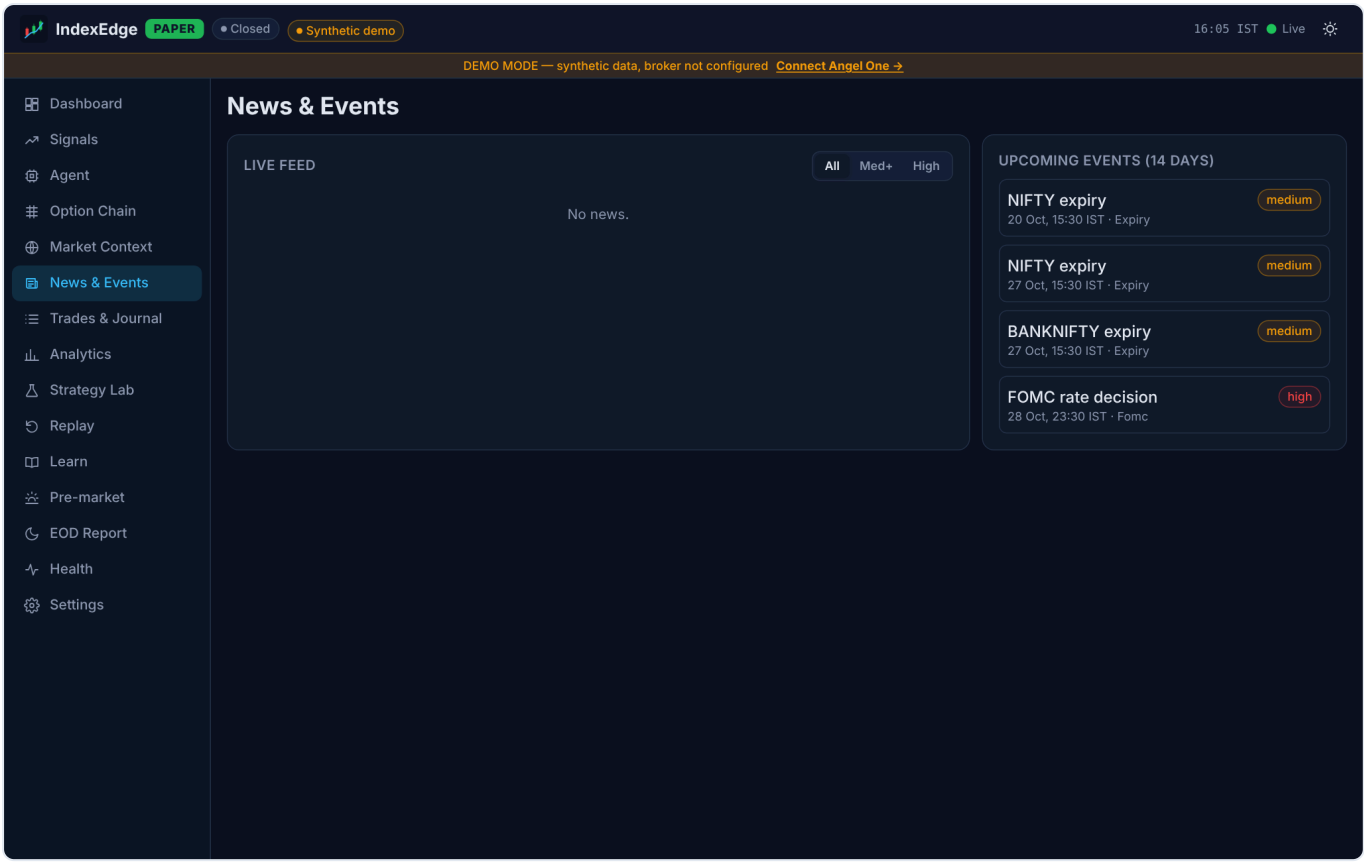

11. Option Chain

Option chain with OI, change in OI, IV and Greeks.

- Calls on the left, puts on the right; the at-the-money strike is highlighted.
- **OI and ΔOI bars** show where positions are building; the colour shows build-up type (long build-up, short build-up, short covering, long unwinding).
- **IV and Greeks** (delta, gamma, theta, vega) are calculated locally with Black-Scholes.
- **PCR, max pain and OI walls** (biggest call/put OI strikes) appear above the table and feed the OI/PCR strategy.

12. News & Events

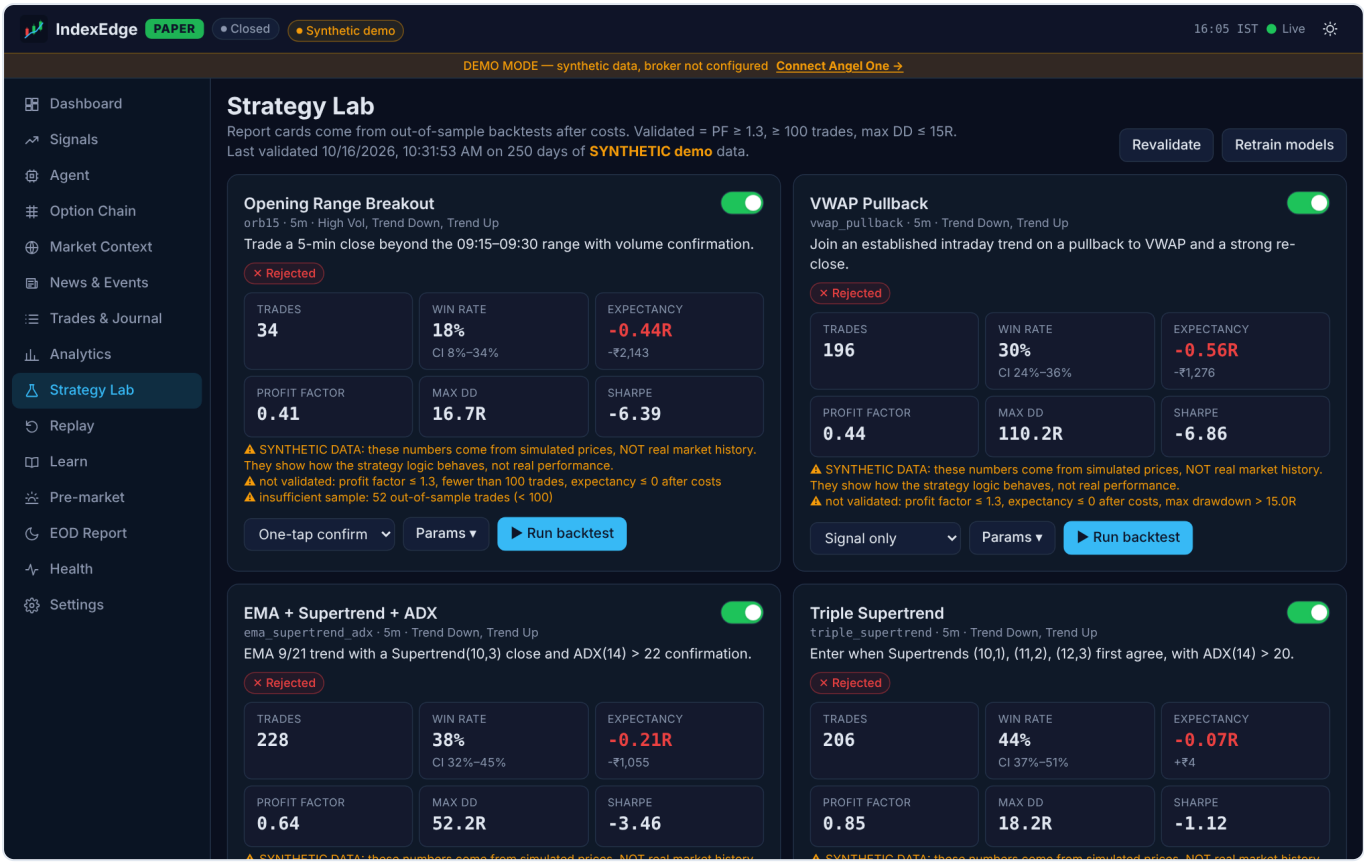

Upcoming events, blackout windows and the news feed.

Headlines from Indian business news, RBI, SEBI and PIB feeds are tagged locally (no AI service) with relevance to Nifty/Bank Nifty, sentiment and impact. The calendar includes RBI policy days, US Fed meetings, US and India CPI, India GDP, the Union Budget and every F&O expiry. During a **blackout window** no new entries are allowed.

The screenshot was taken in a sandbox without internet access to news sites, so the news list is empty there; on your PC it fills within a few minutes.

13. Strategy Lab and backtests

Strategy report cards (demo data shown — every result is labelled SYNTHETIC).

- Each card shows the **report card**: trades, win rate with CI, expectancy (R and ₹), profit factor, max drawdown and Sharpe — from **walk-forward, out-of-sample** backtests after costs.
- **Validated** needs profit factor > 1.3, at least 100 trades, positive expectancy and drawdown ≤ 15R.
- The **toggle** enables a strategy for live signals; the **dropdown** sets its execution mode; **Params** edits its settings (re-validate afterwards).
- **Revalidate** re-runs all report cards on the latest data; **Retrain models** rebuilds the probability models (only ever on real broker history).

> **In demo mode everything is "Rejected"**
>
> That is correct: synthetic random prices have no edge. After you connect Angel One and real history builds up, press **Revalidate** to see real report cards.

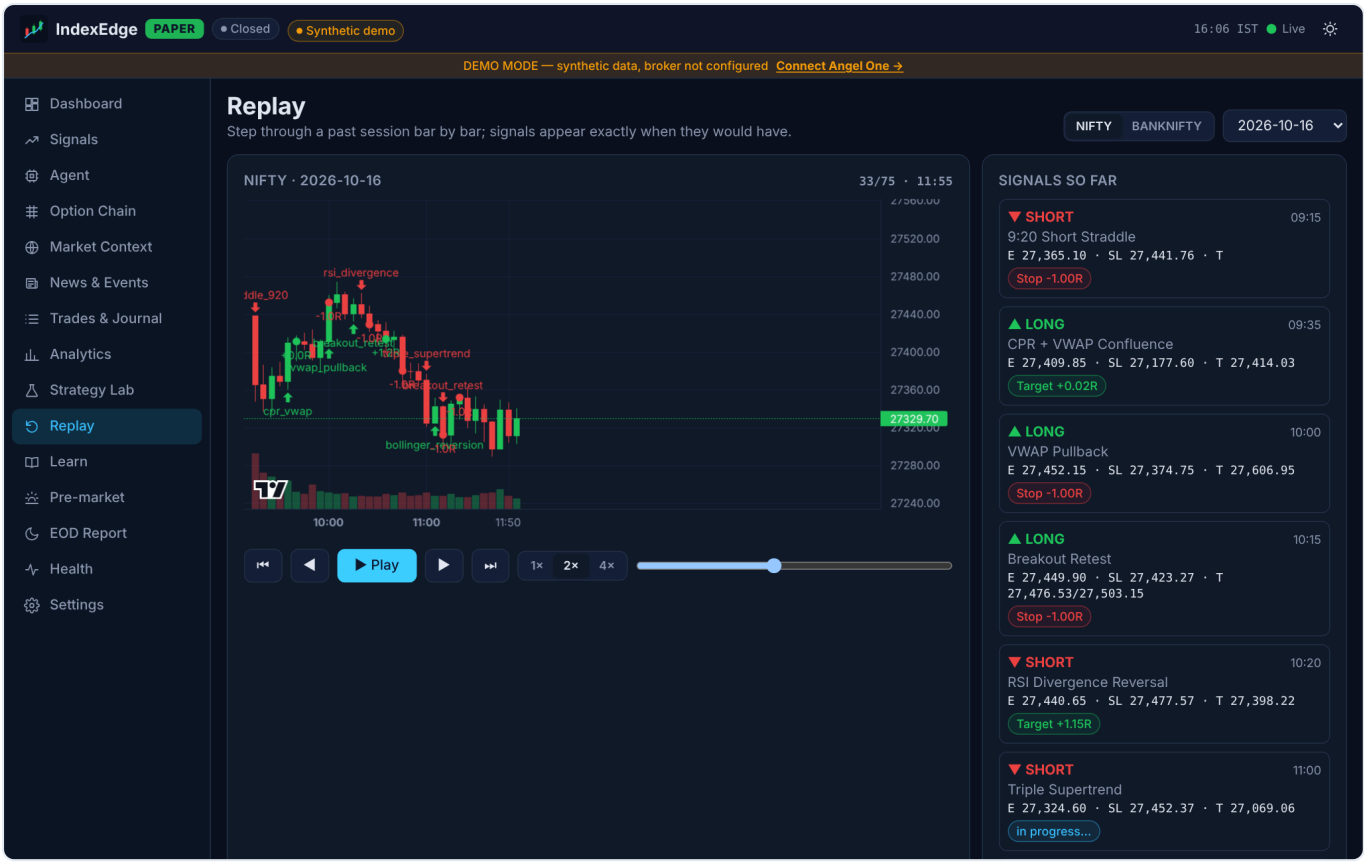

13. Strategy Lab — running a backtest

Backtest results: metrics, equity curve, Monte Carlo drawdowns and walk-forward folds.

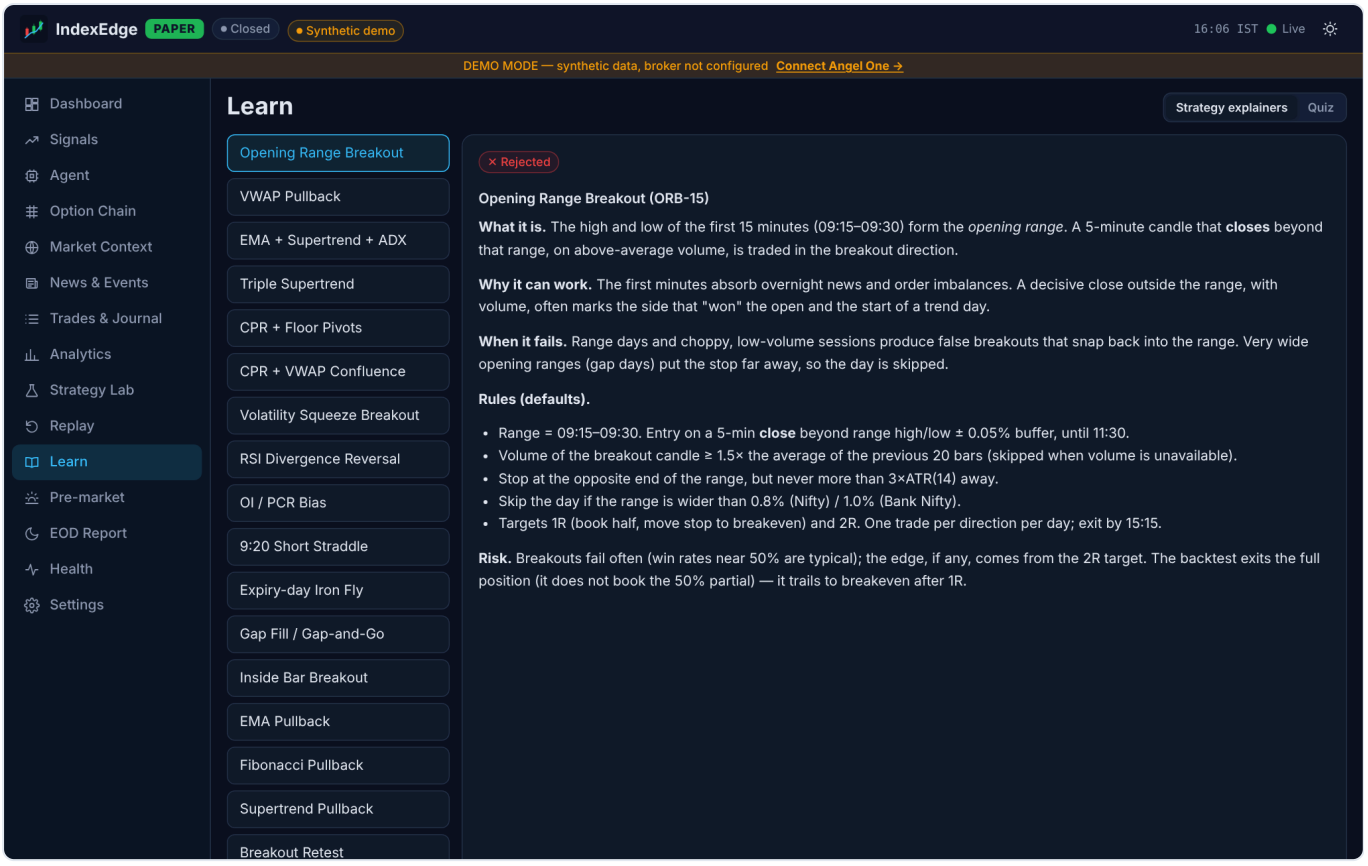

Monte Carlo reshuffles the trade sequence thousands of times to show how deep drawdowns could get (median and 95th percentile). **Walk-forward** tests the strategy on periods it was not tuned on and warns about over-fitting. The reliability diagram (when a model exists) shows whether predicted probabilities matched real outcomes.

14. Replay and Learn

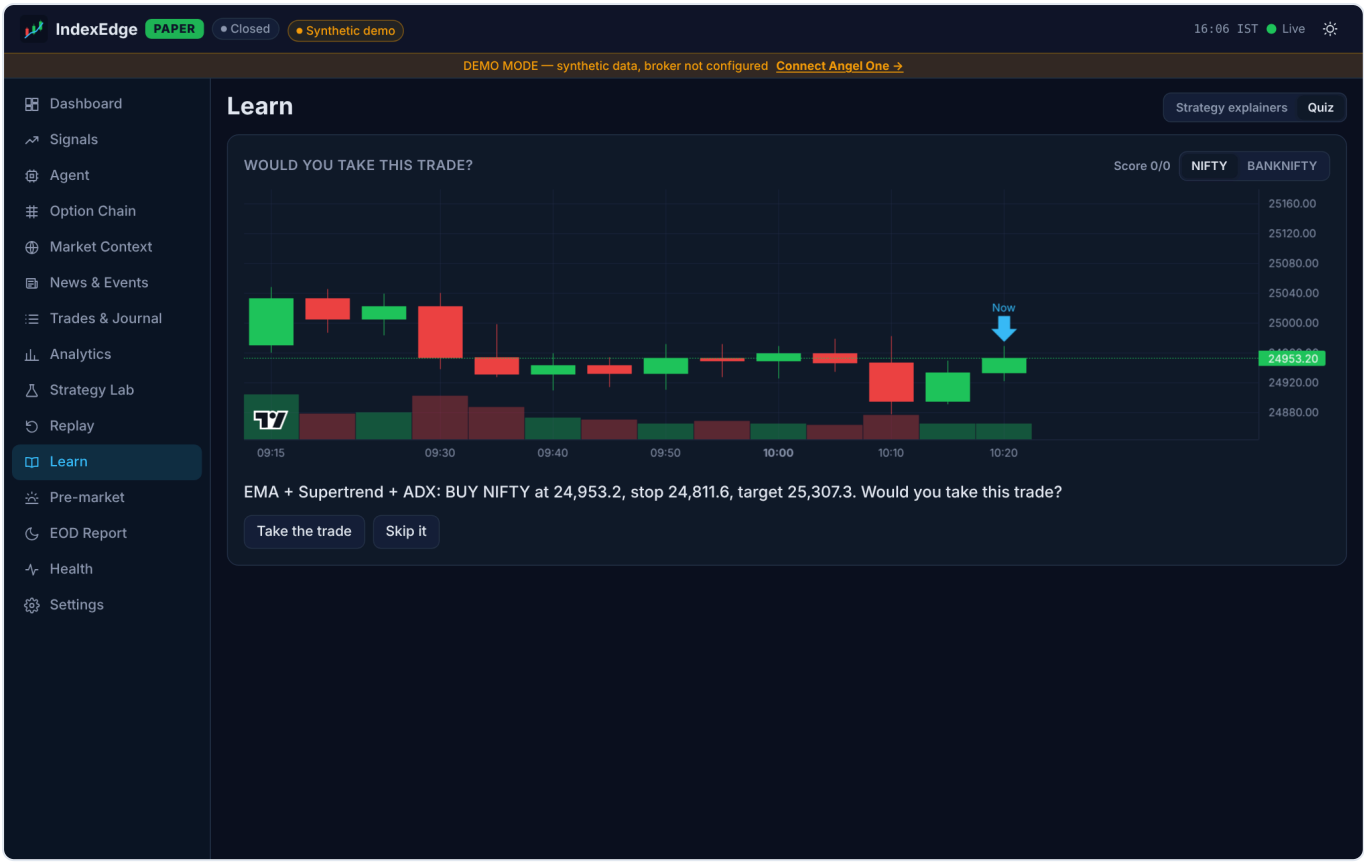

Replay a past day candle by candle and see signals as they would have appeared.

Pick a day, then use ⏮ ◀ ▶ ⏭ or **Play**. Signal markers appear on the bar where they fired, with their outcome (target, stop or time exit) and result in R.

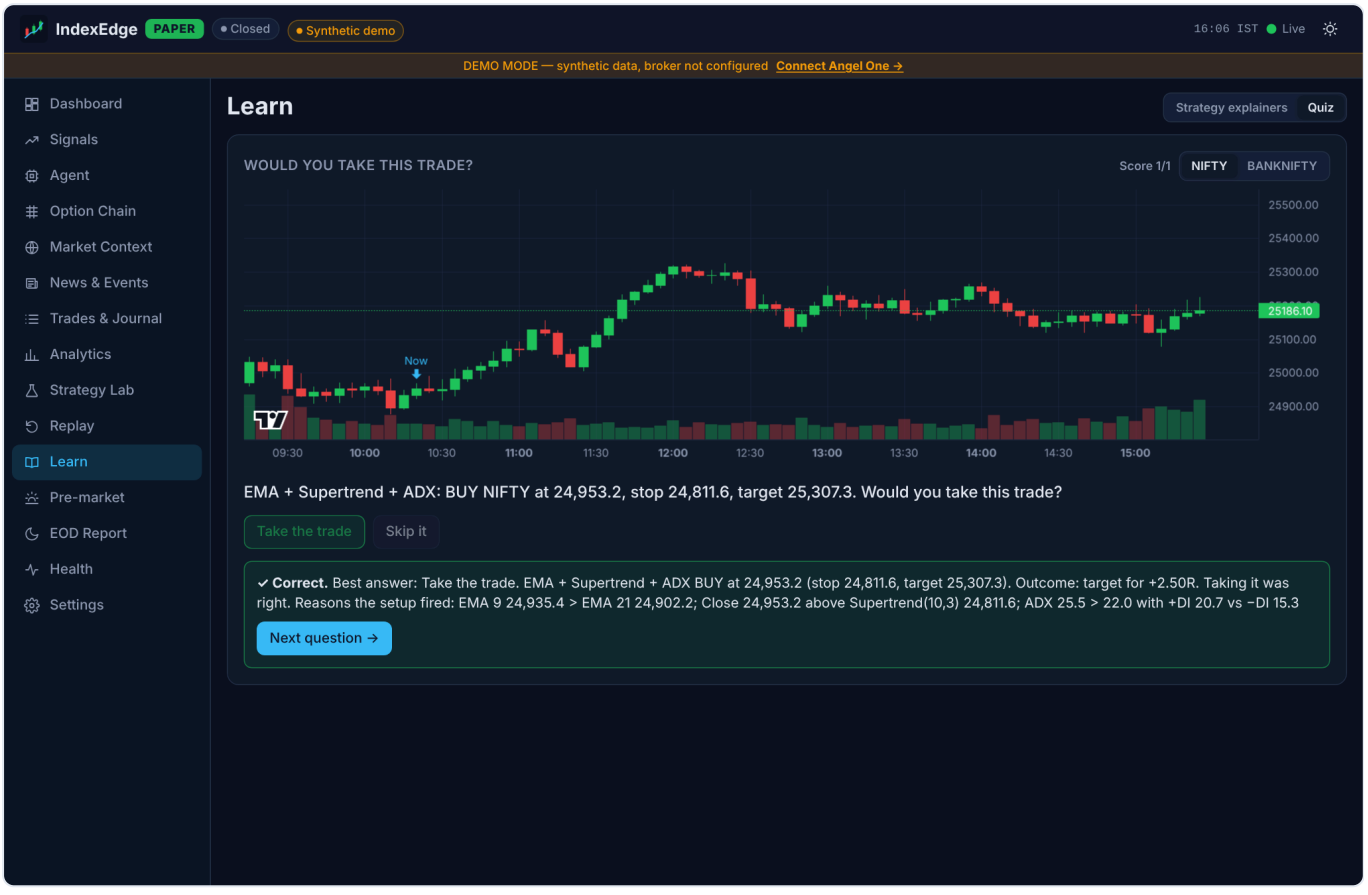

Learn → Strategy explainers: what each strategy does, why it works, when it fails, its rules and risks.

14. Learn — “Would you take this trade?”

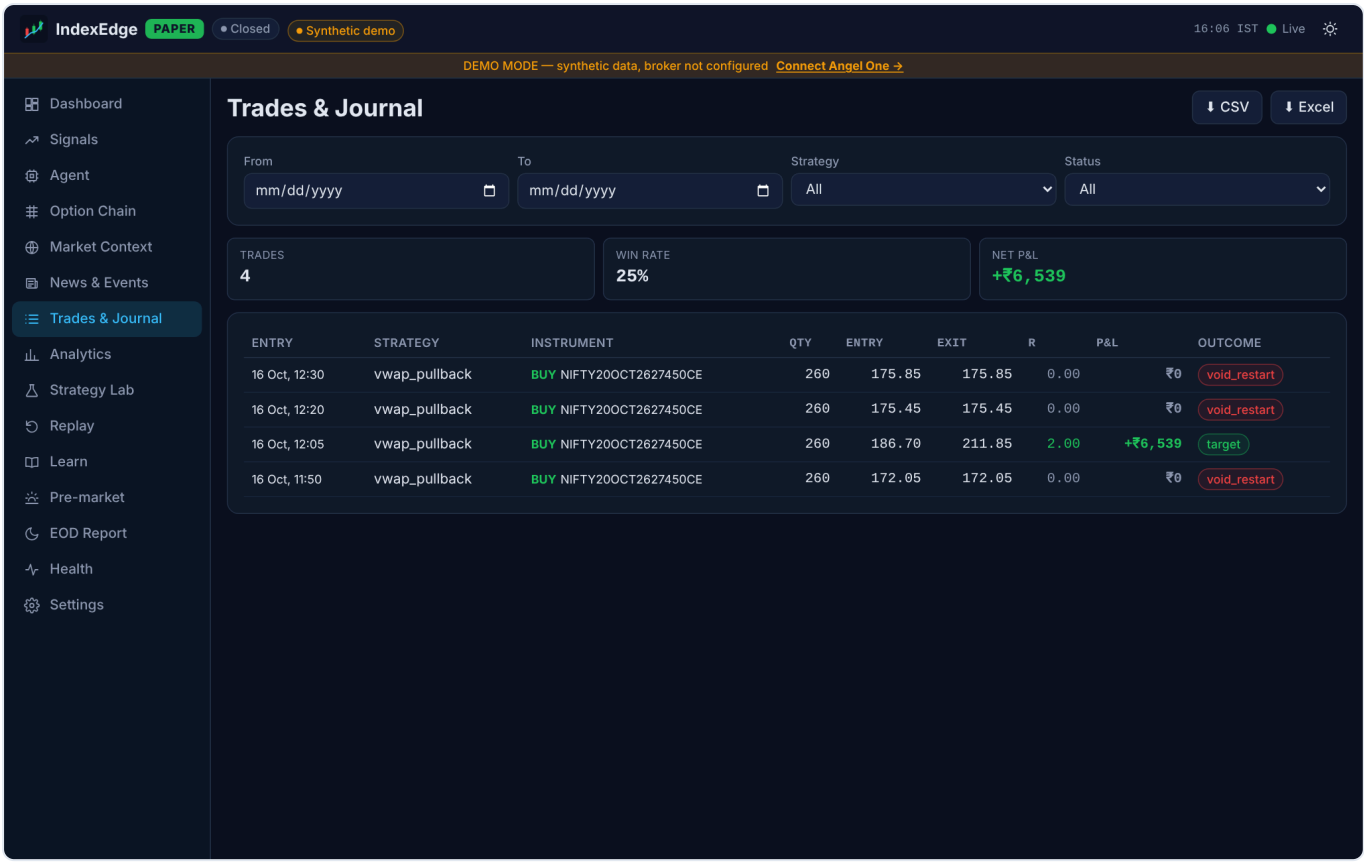

A quiz question from a real setup in recent history.

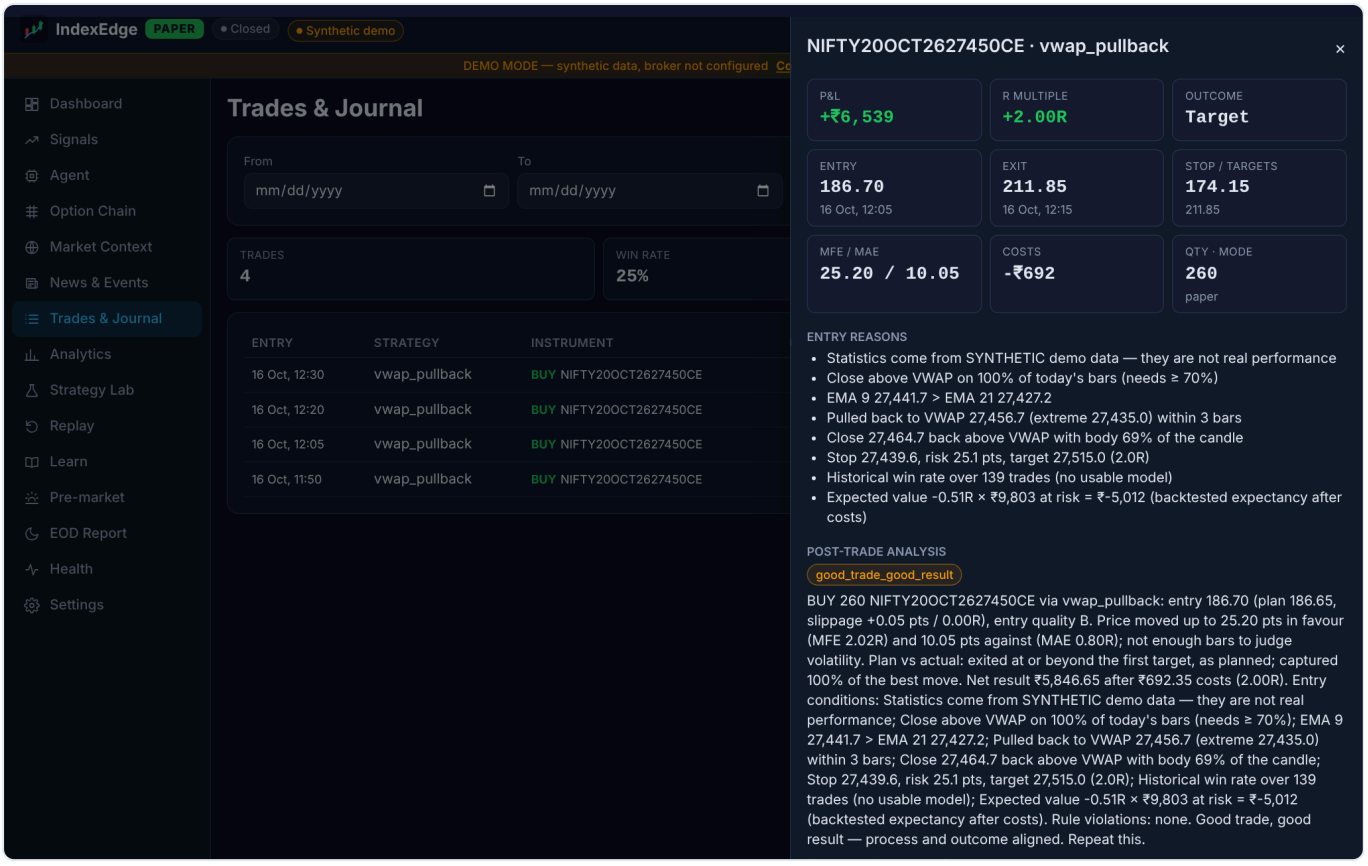

After you answer, the chart reveals what happened and why.

15. Trades, Journal and Analytics

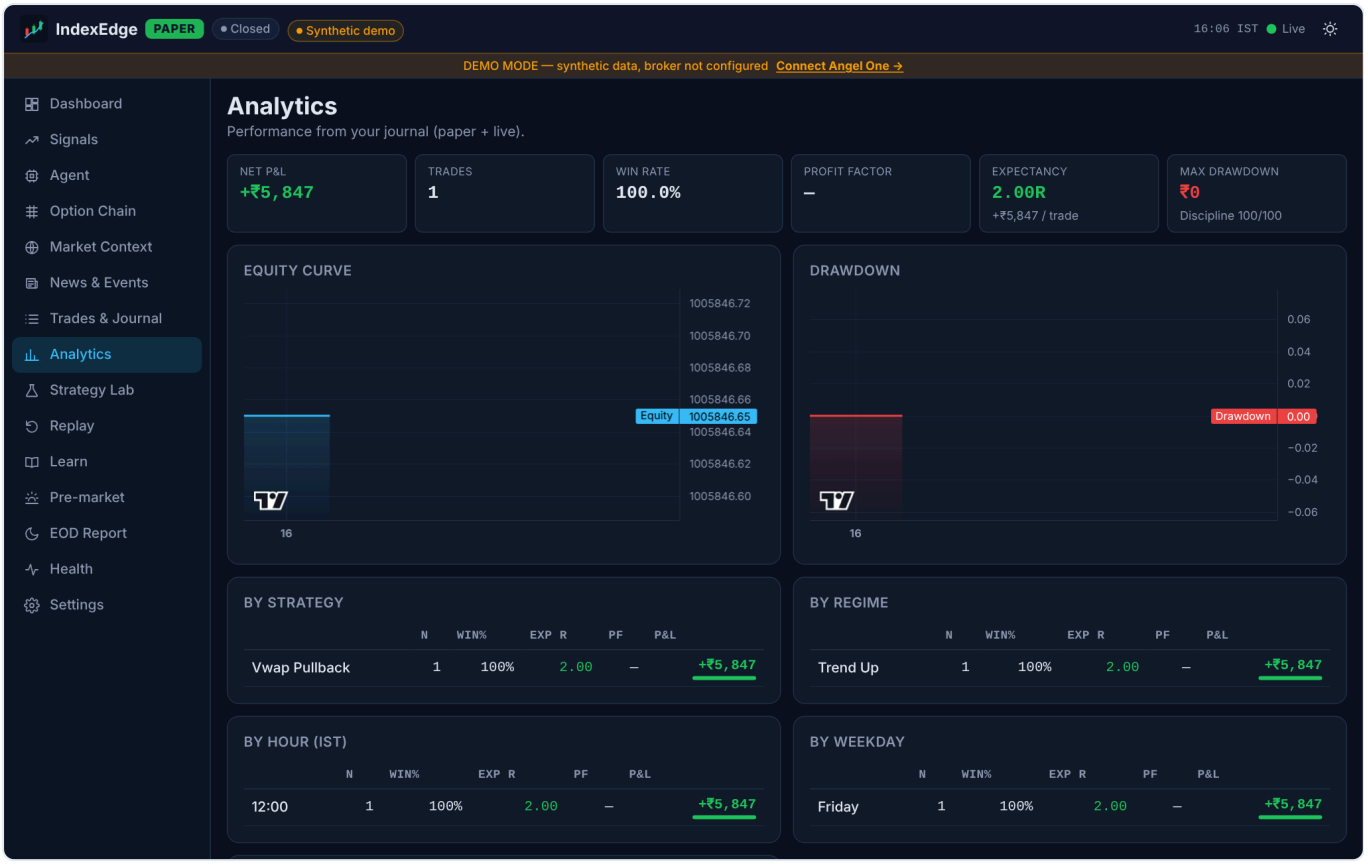

Every trade (paper or live) with filters and CSV/Excel export.

Click a trade to open its detail: the plan versus what happened, the automatic **post-trade analysis** — entry quality, best and worst price reached (MFE/MAE), slippage, rules broken, and whether it was a good or bad *trade* separately from a good or bad *result*. Add your own notes, tags and emotions.

Trade detail with post-trade analysis and notes.

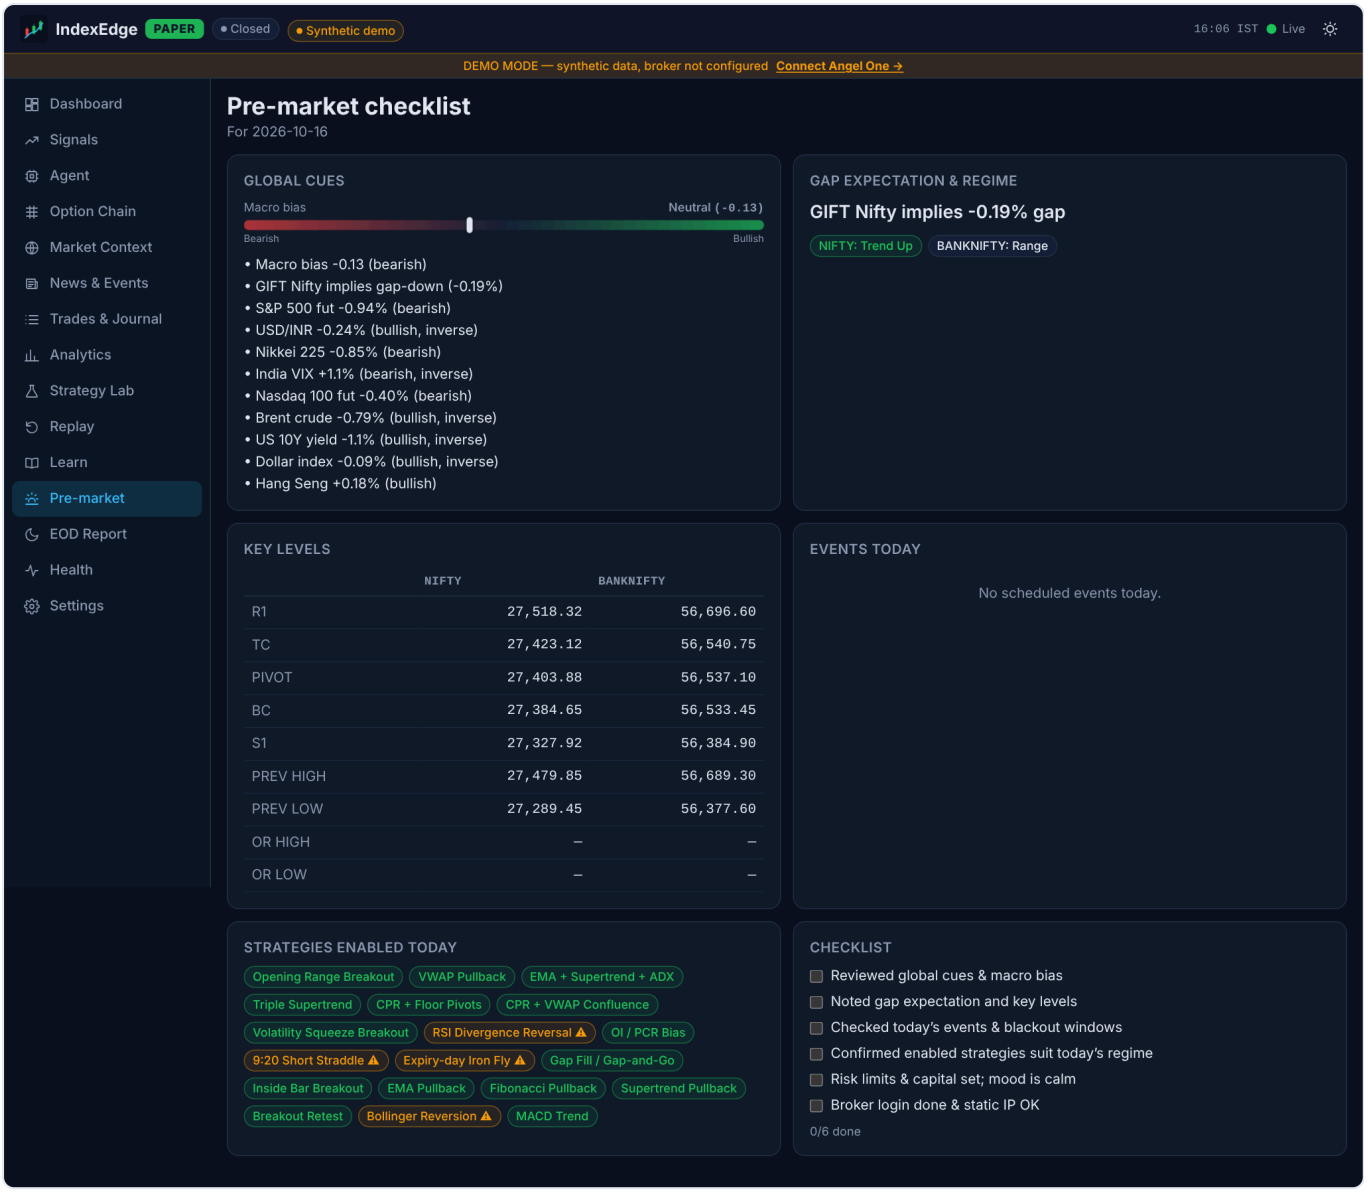

15. Analytics

Equity curve, drawdown and breakdowns.

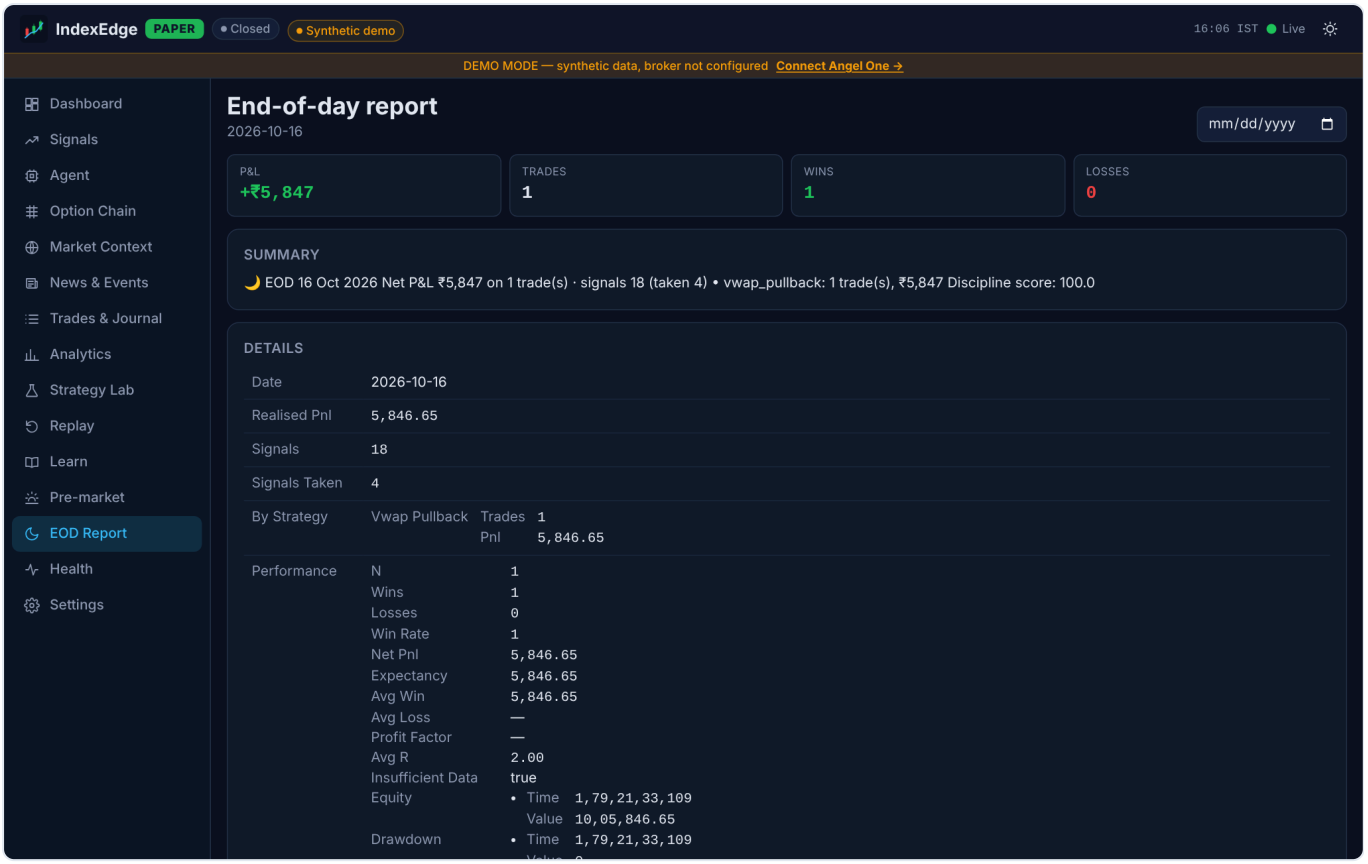

Analytics shows your equity curve and drawdown, win rate, profit factor, expectancy, average R and a **discipline score** (rules followed), broken down by strategy, hour, weekday, regime and index — so you can see what works for *you*. Groups with fewer than 50 trades are marked “insufficient data”.

16. Pre-market checklist and End-of-day report

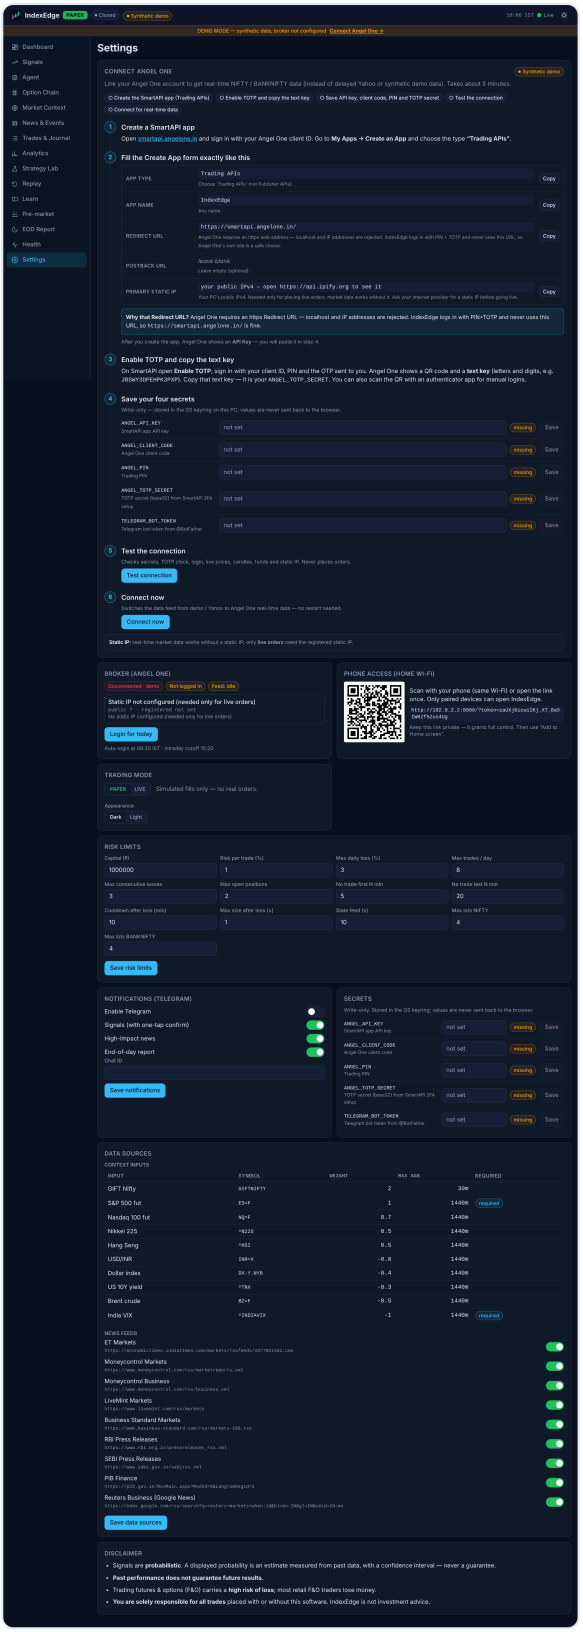

Pre-market: global bias, expected gap, key levels, today's events, checklist and which strategies suit today's regime.

16. End-of-day report

End-of-day report: P&L, trades, signals taken and skipped, discipline score. Also sent to Telegram at 15:45.

17. Settings, risk limits and going live

Settings: broker status and static IP check, phone access, trading mode, risk limits, notifications, secrets and data sources.

17. Settings (continued)

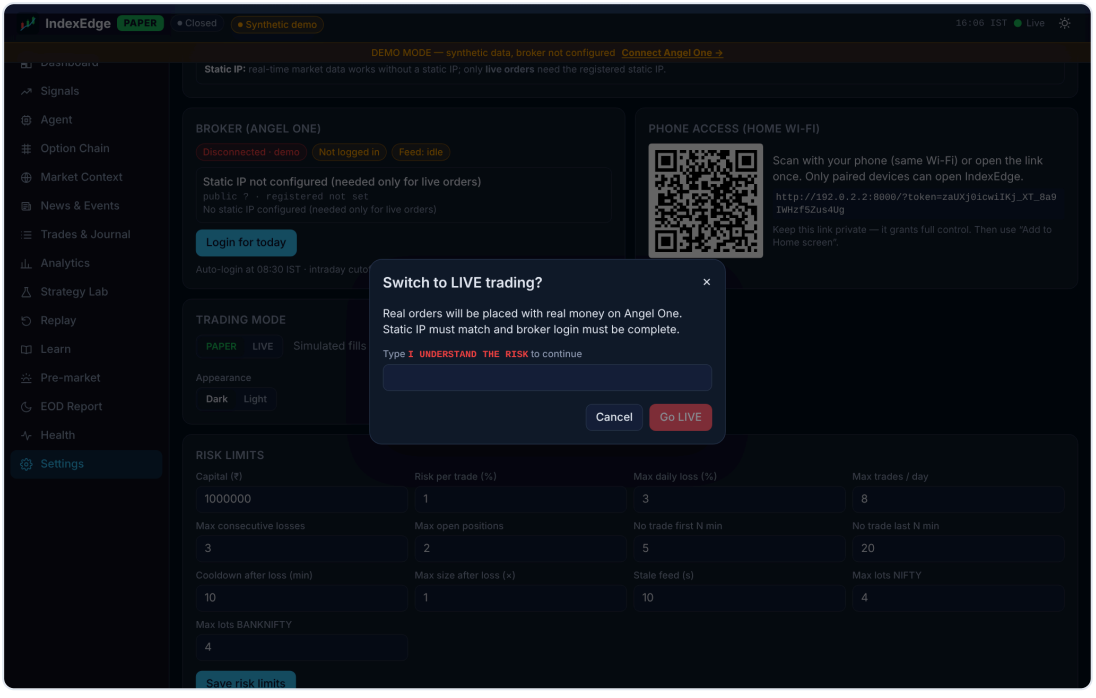

Risk limits

Setting	Default	Meaning
Capital	₹2,00,000	Base for all % limits.
Risk per trade	1%	Maximum loss if the stop is hit; sets the position size (whole lots).
Max daily loss	3%	Reaching it locks trading for the day.
Max trades / day	5	Further entries are refused.
Max consecutive losses	3	Locks trading for the day.
Max open positions · lots per index	2 · 4	Exposure caps.
No trade first / last N min	5 / 20	Avoids the opening and closing minutes.
Cooldown after loss	10 min	Tilt protection; also blocks bigger “revenge” sizes.

Risk limits can only be changed outside market hours (09:00–15:30), so they cannot be loosened in the heat of the moment.

Going live

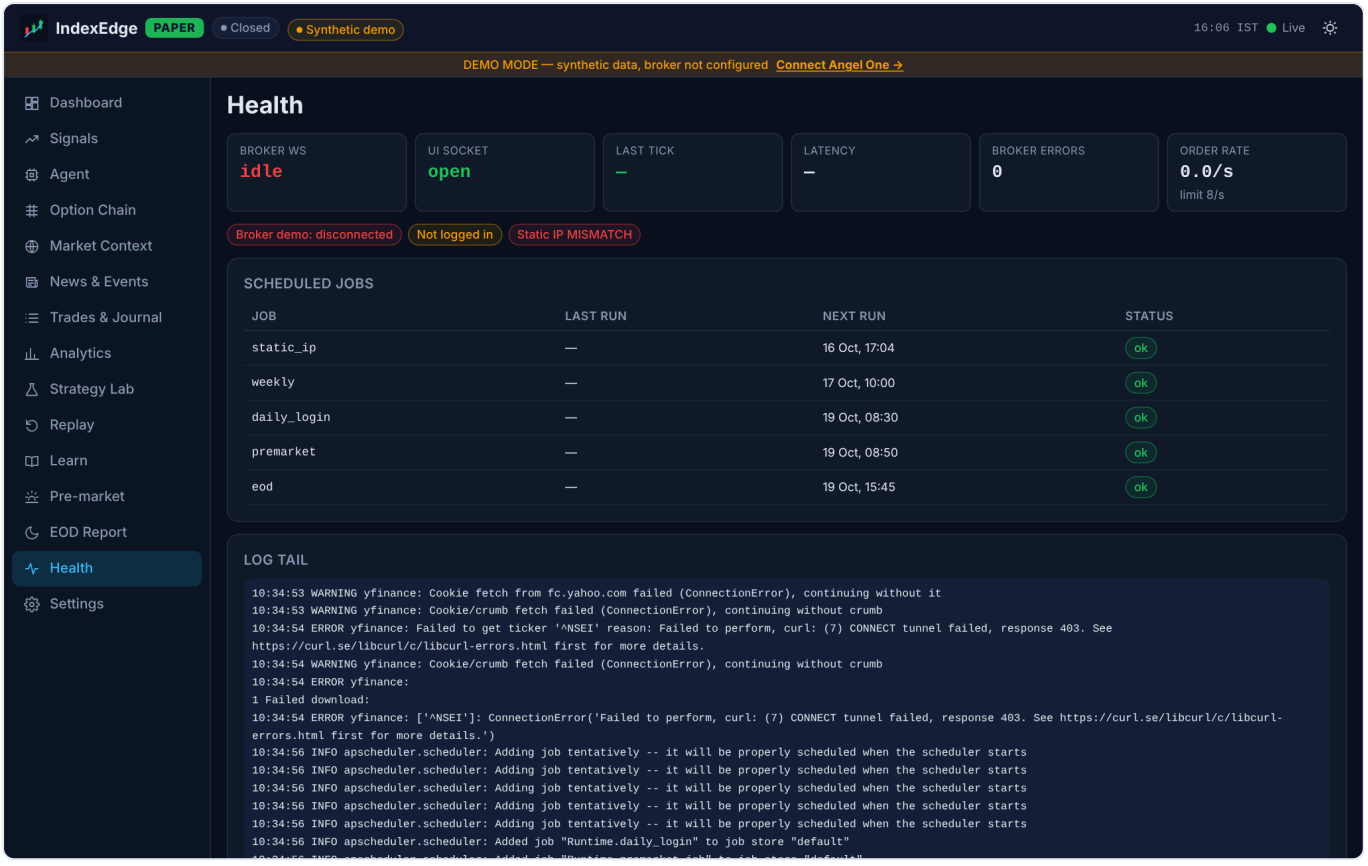

Live mode also requires: Angel One connected, the static IP check passed, no open paper trades and trading not locked. **Paper-trade for several weeks first** and compare the results with the report cards.

Switching to LIVE requires typing the confirmation phrase.

18. Safety features and Health

- **Paper by default.** Live needs typed confirmation and passing checks.
- **Order rules:** only LIMIT and stop-loss-limit orders, never market, IOC or after-market orders; at most 8 orders per second (SEBI's retail algo threshold is 10).
- **Protective stop** placed right after every entry; on restart IndexEdge re-adopts stops already resting at the broker instead of doubling them.
- **Kill switch** cancels everything, squares off and locks the day.
- **Safe mode** starts automatically when market data stops or an order's state is unknown: no new entries, existing stops stay at the broker, positions are re-checked with Angel One, and you are alerted.
- **Static IP guard**, **daily login** and an **audit log** of every order request and response (secrets removed).

Health: data feed status, delay since the last tick, broker errors, order rate, scheduled jobs and recent log lines.

19. Troubleshooting

Problem	What to do
“Daily login failed” alert	Check PIN and TOTP secret in Settings. Make sure the PC clock is correct (TOTP depends on time). Press **Login for today**.
Live orders blocked: static IP	Your public IP changed or isn’t registered. Compare Settings → Broker with the IP shown at `api.ipify.org`, and update the SmartAPI app.
Every signal blocked: “External context unavailable or stale”	Global market data couldn’t be fetched (internet or data source down). Signals stay blocked until it recovers — by design.
iPad can’t open the address at home	Same Wi-Fi? PC on and the IndexEdge window open? Firewall rule added (re-run `install.bat`)?
iPad keeps asking to log in / “Too many attempts”	Use the latest link (the free Cloudflare link changes when IndexEdge restarts). After 5 wrong passwords wait 15 minutes; the username is not case-sensitive.
Remote access says “Tunnel stopped”	The PC’s internet is down or a firewall/antivirus blocks Cloudflare. It retries automatically.
Want a permanent remote link	Optional: create a free Cloudflare account and a “named tunnel” to `http://localhost:8000`, then turn the built-in quick link off. IndexEdge’s login still protects every request.
No sound on the iPad	Tap **Enable sound** again after the iPad was locked, and keep IndexEdge open.
Red “SAFE MODE” bar	Market data stopped or an order state was unclear. Stops remain at the broker; new entries pause until IndexEdge has re-checked your positions.
Amber “Not enough real history” bar	Real candles are still downloading; signals for that index are withheld until at least 5 sessions are available.
A paper trade shows outcome “void_restart”	IndexEdge was closed while a **paper** trade was open. Paper positions are simulated in memory, so the trade is voided with zero P&L. Live trades are different: positions and stops are at Angel One and are re-checked on restart.
Installer stops with an error	Check your internet connection and run `install.bat` again — it is safe to re-run.
Uninstall	Delete the IndexEdge folder and desktop icon, the “IndexEdge” task in Task Scheduler (if created), and the IndexEdge entries in Credential Manager → Windows Credentials.

20. Disclaimer

Signals are probabilistic estimates measured from past data — never guarantees. Past performance does not guarantee future results. Trading futures and options carries a high risk of loss; SEBI found that over 9 in 10 individual F&O traders lost money. You are solely responsible for every trade placed with or without IndexEdge. IndexEdge is personal software for use on your own account only and is not investment advice.

Good habits

- A 60% setup still loses 4 times out of 10 — size so that a losing streak is survivable.
- Judge yourself on process (discipline score, rules followed), not on single results.
- Re-validate strategies after big market changes (lot sizes, expiry rules, volatility regimes).
